THE CENTURY DICTIONARY

PREPARED UNDER THE SUPERINTENDENCE OF

WILLIAM DWIGHT WHITNEY, PH. D., LL. D.

PROFESSOR OF COMPARATIVE PHILOLOGY AND SANSKRIT IN YALE UNIVERSITY

THE plan of "The Century Dictionary" includes three things: the construction of a general dictionary of the English language which shall be serviceable for every literary and practical use; a more complete collection of the technical terms of the various sciences, arts, trades, and professions than has yet been attempted; and the addition to the definitions proper of such related encyclopedic matter, with pictorial illustrations, as shall constitute a convenient book of general reference.

About 200,000 words will be defined. The Dictionary will be a practically complete record of all the noteworthy words which have been in use since English literature has existed, especially of all that wealth of new words and of applications of old words which has sprung from the development of the thought and life of the nineteenth century. It will record not merely the written language, but the spoken language as well (that is, all important provincial and colloquial words), and it will include (in the one alphabetical order of the Dictionary) abbreviations and such foreign words and phrases as have become a familiar part of English speech.

THE ETYMOLOGIES.

The etymologies have been written anew on a uniform plan, and in accordance with the established principles of comparative philology. It has been possible in many cases, by means of the fresh material at the disposal of the etymologists, to clear up doubts or difficulties hitherto resting upon the history of particular words, to decide definitely in favor of one of several suggested etymologies, to discard numerous current errors, and to give for the first time the history of many words of which the etymologies were previously unknown or erroneously stated. Beginning with the current accepted form of spelling, each important word has been traced back through earlier forms to its remotest known origin. The various prefixes and suffixes useful in the formation of English words are treated very fully in separate articles.

HOMONYMS.

Words of various origin and meaning but of the same spelling, have been distinguished by small superior figures (^{1}, ^{2}, ^{3}, etc.). In numbering these homonyms the rule has been to give precedence to the oldest or the most familiar, or to that one which is most nearly English in origin. The superior numbers apply not so much to the individual word as to the group or root to which it belongs, hence the different grammatical uses of the same homonym are numbered alike when they are separately entered in the Dictionary. Thus a verb and a noun of the same origin and the same present spelling receive the same superior number. But when two words of the same form and of the same radical origin now differ considerably in meaning, so as to be used as different words, they are separately numbered.

THE ORTHOGRAPHY.

Of the great body of words constituting the familiar language the spelling is determined by well-established usage, and, however accidental and unacceptable, in many cases, it may be, it is not the office of a dictionary like this to propose improvements, or to adopt those which have been proposed and have not yet won some degree of acceptance and use. But there are also considerable classes as to which usage is wavering, more than one form being sanctioned by excellent authorities, either in this country or Great Britain, or in both. Familiar examples are words ending in *or* or *our* (as *labor, labour*), in *er* or *re* (as *center, centre*), in *ize* or *ise* (as *civilize, civilise*); those having a single or double consonant after an unaccented vowel (as *traveler, traveller*), or spelled with *e* or with *æ* or *œ* (as *hemorrhage, hæmorrhage*); and so on. In such cases both forms are given, with an expressed preference for the briefer one or the one more accordant with native analogies.

THE PRONUNCIATION.

No attempt has been made to record all the varieties of popular or even educated utterance, or to report the determinations made by different recognized authorities. It has been necessary rather to make a selection of words to which alternative pronunciations should be accorded, and to give preference among these according to the circumstances of each particular case, in view of the general analogies and tendencies of English utterance. The scheme by which the pronunciation is indicated is quite simple, avoiding over-refinement in the discrimination of sounds, and being designed to be readily understood and used. (See Key to Pronunciation on back cover.)

DEFINITIONS OF COMMON WORDS.

In the preparation of the definitions of common words, there has been at hand, besides the material generally accessible to students of the language, a special collection of quotations selected for this work from English books of all kinds and of all periods of the language, which is probably much larger than any which has hitherto been made for the use of an English dictionary, except that accumulated for the Philological Society of London. Thousands of non-technical words, many of them occurring in the classics of the language, and thousands of meanings, many of them familiar, which have not hitherto been noticed by the dictionaries, have in this way been obtained. The arrangement of the definitions historically, in the order in which the senses defined have entered the language, has been adopted wherever possible.

THE QUOTATIONS.

These form a very large collection (about 200,000), representing all periods and branches of English literature. The classics of the language have been drawn upon, and valuable citations have been made from less famous authors in all departments of literature. American writers especially are represented in greater fullness than in any similar work. A list of authors and works (and editions) cited will be published with the concluding part of the Dictionary.

DEFINITIONS OF TECHNICAL TERMS.

Much space has been devoted to the special terms of the various sciences, fine arts, mechanical arts, professions, and trades, and much care has been bestowed upon their treatment. They have been collected by an extended search through all branches of literature, with the design of providing a very complete and many-sided technical dictionary. Many thousands of words have thus been gathered which have never before been recorded in a general dictionary, or even in special glossaries. To the biological sciences a degree of prominence has been given corresponding to the remarkable recent increase in their vocabulary. The new material in the departments of biology and zoölogy includes not less than five thousand words and senses not recorded even in special dictionaries. In the treatment of physical and mathematical sciences, of the mechanical arts and trades, and of the philological sciences, an equally broad method has been adopted. In the definition of theological and ecclesiastical terms, the aim of the Dictionary has been to present all the special doctrines of the different divisions of the Church in such a manner as to convey to the reader the actual intent of those who accept them. In defining legal terms the design has been to offer all the information that is needed by the general reader, and also to aid the professional reader by giving in a concise form all the important technical words and meanings. Special attention has also been paid to the definitions of the principal terms of painting, etching, engraving, and various other art-processes; of architecture, sculpture, archæology, decorative art, ceramics, etc.; of musical terms, nautical and military terms, etc.

ENCYCLOPEDIC FEATURES.

The inclusion of so extensive and varied a vocabulary, the introduction of special phrases, and the full description of things often found essential to an intelligible definition of their names, would alone have given to this Dictionary a distinctly encyclopedic character. It has, however, been deemed desirable to go somewhat further in this direction than these conditions render strictly necessary.

Accordingly, not only have many technical matters been treated with unusual fullness, but much practical information of a kind which dictionaries have hitherto excluded has been added. The result is that "The Century Dictionary" covers to a great extent the field of the ordinary encyclopedia, with this principal difference — that the information given is for the most part distributed under the individual words and phrases with which it is connected, instead of being collected under a few general topics. Proper names, both biographical and geographical, are of course omitted, except as they appear in derivative adjectives, as *Darwinian* from *Darwin*, or *Indian* from *India*. The alphabetical distribution of the encyclopedic matter under a large number of words will, it is believed, be found to be particularly helpful in the search for those details which are generally looked for in works of reference.

ILLUSTRATIONS.

The pictorial illustrations have been so selected and executed as to be subordinate to the text, while possessing a considerable degree of independent suggestiveness and artistic value. To secure technical accuracy, the illustrations have, as a rule, been selected by the specialists in charge of the various departments, and have in all cases been examined by them in proofs. The cuts number about six thousand.

MODE OF ISSUE, PRICE, ETC.

"The Century Dictionary" will be comprised in about 6,500 quarto pages. It is published by subscription and in twenty-four parts or sections, to be finally bound into six quarto volumes, if desired by the subscriber. These sections will be issued about once a month. The price of the sections is $2.50 each, and no subscriptions are taken except for the entire work.

The plan of the Dictionary is more fully described in the preface (of which the above is in part a condensation), which accompanies the first section, and to which reference is made.

A list of the abbreviations used in the etymologies and definitions, and keys to pronunciations and to signs used in the etymologies, will be found on the back cover-lining.

car-brake (kär'brāk), *n.* A brake used to arrest the motion of a railroad-car. When operated by hand, it comprises a brake-wheel, brake-shaft, brake-chain, brake-lever, and brake-shoe, with their various parts. (See *brake-shaft, brake-shoe,* and *brake-wheel.*) Where other than hand-power is used, the brake consists essentially of the shoe and lever and some means (as a coiled spring, steam, compressed air, or the pressure of the air acting in a vacuum) for developing power and applying it to operate the brake-lever. When all the brakes of a train are operated together by a single application of power, the apparatus is called a *continuous brake.* The most important forms of such brakes are the Westinghouse brake and the vacuum-brake. (See *air-brake.*) Some continuous brakes, as the improved Westinghouse, are operated by the breaking apart of the cars in the train, and are called *automatic* or *self-setting brakes.* See cut under *brake*^{3}.

When held up to the sun it loses its deep tinge, and becomes of the color of a burning coal. It was formerly believed to be capable of shining in darkness. The carbuncle of the ancients is believed to have been a garnet, some varieties of which still go by that name, though the name included also the ruby and the spinel.

carbureter, carburetor (kär'bū-ret-ėr, -or), *n.* [< *carburet* + *-er*^{1}, *-or.*] **1.** An apparatus for adding hydrocarbons to non-luminous or poor gases, for the purpose of producing an illuminating gas. This is effected by the addition of volatile hydrocarbons, or by placing material rich in hydrocarbons in the charge in the gas-retort, or by causing the gas to pass through liquid hydrocarbons to take up the more volatile vapors. Air-carbureters are of this last class. Various devices are employed to saturate the air with the vapor, but all are essentially alike.

2. A hydrocarbon used for this purpose.

The lightest distillates of American petroleum, Sherwood oil, or shale, have been much investigated in regard to use as anæsthetics or as *carburetters.* *Ure,* Dict., III. 399.

The wolverene has been confused not only with the lynx and cougar in early times, but also quite recently with the American badger, *Taxidea americana.* Thus F. Cuvier (supp. to Buffon, ed. 1831, I. 267) treats at length of "le *carcajou* ou blaireau américain," . . . to which he misconceives the name *carcajou* to belong.

It. *carcinoma*), < Gr. καρκίνωμα, a cancer, < καρκινοῦν, affect with cancer, < καρκίνος, a crab, cancer: see *carcinus* and *cancer*.] A tumor which grows more or less rapidly, tends to break down and ulcerate in its later stages, propagates itself in neighboring or more distant parts, and after excision very frequently recurs; a cancer, in the stricter sense of that word. A carcinoma is characterized microscopically by trabeculæ and nodular masses of cells of epithelial form and origin, running in a stroma of tissue of mesoblastic origin. Several types are distinguished: (1) flat-celled epithelioma; (2) cylinder-celled epithelioma; (3) simple carcinoma (carcinoma simplex), a variety of glandular carcinoma forming nodular tumors of considerable consistency; (4) carcinoma scirrhosum, or scirrhous cancer, a variety forming very hard nodules of almost the consistency of cartilage; (5) carcinoma gelatinosum, or cancer with colloid degeneration of the epithelial parts; colloid cancer; (6) carcinoma myxomatodes, or cancer with the stroma consisting of mucous tissue; (7) cylindroma carcinomatodes; (8) carcinoma gigantocellulare; (9) melanocarcinoma. Certain pathologists exclude the epitheliomata from the carcinomata, and hold that the latter are not of epithelial origin, but are purely a mesoblastic formation. Some, again, founding the definition of carcinomata entirely on anatomical features, independently of histogenetic considerations, include in them the sarcomata alveolaria. The softer carcinomata are as a rule the more rapidly fatal. The earlier a cancer is removed, the greater is the prolongation of life and the chance of escaping a return. See *cylindroma*, *epithelioma*, *sarcoma*.—**Alveolar carcinoma.** See *alveolar*.

A cardinal priest may be a bishop or an archbishop, and a cardinal deacon may be of any ecclesiastical grade below bishop. The college of cardinals is seldom full, vacancies nearly always existing. The dress of a cardinal is a red soutane or cassock, a rochet, a short purple mantle, and a low-crowned, broad-brimmed red hat (not actually worn), with two cords depending from it, one from either side, each having fifteen tassels at its extremity.

carding-engine (kär′ding-en″jin), *n.* Same as *carding-machine.*

carding-machine (kär′ding-mạ-shēn″), *n.* A machine for carding fibers of wool, flax, or cotton, preparatory to drawing and spinning. In the earlier carding-machines the fibers were fed by hand to a cylinder upon which card-clothing was laid in strips parallel to the axis, and were removed from these strips by hand as they became full. In modern cotton-carding machines a loose roll of fibers, called a *lap*, is placed in guides and rests upon a roller, which as it revolves unwinds the lap and delivers it to the *feed-roll*, on passing through which it is seized by the card-teeth upon a small cylinder, called the *licker-in*, from which it is drawn by the teeth of the clothing of the main cylinder. Other small cylinders successively remove the fibers from and deliver them to the main cylinder. The tufts, tangles, or knots which are not loosened by the action of these cylinders project beyond the teeth of the main cylinder, and are caught by the teeth of a succession of wooden slats called *card-tops, top-cards*, or *top-flats*, from which they are cleared or stripped by hand or by mechanical devices. The fibers upon the main cylinder are laid parallel upon it, and are removed by means of the *doffer*, a cylinder moving in an opposite direction from the main cylinder and at a very much slower rate, and whose whole surface is covered by card-clothing. The cotton is stripped from the doffer in a thin continuous sheet of its full width, by means of a comb vibrating vertically in contact with the teeth of the doffer. This sheet of fibers is drawn together into a ribbon, traverses a funnel or trumpet, and is passed between successive pairs of rolls, which draw out and condense the sliver, and finally deliver it into the can ready for the *drawing-frame*, where it is doubled and drawn preparatory to twisting or spinning. For fine work, the operation of carding is repeated. The preparatory card or cards are called *breakers*, and those machines on which the carding is completed are called *finishers.* The principle of the wool-carding machine is identical with that of the cotton-carding machine, and it is chiefly distinguished from the latter by a great number of small cylinders called *urchins*, which work in pairs and are called *workers* and *cleaners.* The worker is the larger of the two; it strips the wool from the large main cylinder, and is itself cleaned by the smaller cylinder or cleaner, which delivers the wool back to the main cylinder, when it is again seized by the next worker. Wool-fibers are oiled to facilitate carding and to prevent felting.

Doublet *chare* (in *Chare Thursday*); deriv. *chary*, q. v.] **1†.** Grief; sorrow; affliction; pain; distress.

Extraordinary care, ordinary care. See the adjectives.—**Take care**, be careful; beware.—**To have a care.** See *have*.—**To have the care of**, to have charge of. = **Syn.** *Care*, *Concern*, *Solicitude*, *Anxiety*. *Care* is the widest in its range of meaning; it may be with or without feeling, with or without action: as, the *care* of a garden. In its strongest sense, *care* is a painful burden of thought, perhaps from a multiplicity and constant pressure of things to be attended to: as, the child was a great *care* to her. *Concern* and *solicitude* are a step higher in intensity. *Concern* is often a regret for painful facts. *Care* and *concern* may represent the object of the thought and feeling; the others represent only the mental state: as, it shall be my chief *concern*. *Solicitude* is sometimes tenderer than *concern*, or is attended with more manifestation of feeling. *Anxiety* is the strongest of the four words; it is a restless dread of some evil. As compared with *solicitude*, it is more negative: as, *solicitude* to obtain preferment, to help a friend; *anxiety* to avoid an evil. We speak of *care* for an aged parent, *concern* for her comfort, *solicitude* to leave nothing undone for her welfare, *anxiety* as to the effect of an exposure to cold. (For *apprehension* and higher degrees of *fear*, see *alarm*.)

It was long since observed by Horace that no ship could leave *care* behind. *Johnson.*

>
> *Howells*, Venetian Life, xx.

=**Syn.** *Caricature, Burlesque, Parody, Travesty.* The distinguishing mark of a *caricature* is that it absurdly exaggerates that which is characteristic, it may be by picture or by language. A *burlesque* renders its subject ludicrous by an incongruous manner of treating it, as by treating a grave subject lightly, or a light subject gravely. *Burlesque* may be intentional or not. A *parody* intentionally burlesques a literary composition, generally a poem, by imitating its form, style, or language. In a *parody* the characters are changed, while in a *travesty* they are retained, only the language being made absurd. (See *travesty*.) In a *burlesque* of a literary work the characters are generally changed into others which ludicrously suggest their originals.

=**Syn.** *Revel, Carousal, Wassail, Spree, Debauch, Saturnalia, Orgy* agree in expressing times of excess in drinking; some of them include other sensual pleasures. They are in the order of strength and consequent reprobation implied. A *revel* is accompanied with some drunkenness, disorder, and noise. A *carousal* is by derivation a time of drinking deeply; it may be a bacchanalian feast, a noisy, unrestrained drinking-bout. *Wassail* is limited by its associations with the past so as to be chiefly poetic or to express deep drinking. *Spree* is considered a colloquial word, but seems likely to win recognition as a convenient word for a period of drunkenness which incites to wild and reckless action. *Debauch* is distinctively excess, having less reference now than formerly to eating, applying chiefly to gross lewdness or drunkenness, which is often prolonged. *Saturnalia*, like *wassail*, has historical associations; it is a strong word for license, noisy revelry, gross and continued debauchery. *Orgy* is by derivation a secret nocturnal debauch, and by usage a time of joining in a wild or frantic abandonment to drunkenness or lust, or both—the extreme in that kind of misconduct. See *feast.*

There are numerous varieties, the most notable being (*a*) the normal form or *scale-carp* just described, (*b*) the *mirror-carp*, distinguished by very large scales below the dorsal, above the anal, and in a median posterior row, and (*c*) the *leather-carp*, characterized by its almost or quite naked skin. In the ordinary Brussels carpet both the pattern and the ground are left with the loops uncut; in the imperial Brussels carpet the pattern is raised above the ground, and its loops are cut so as to form a pile, those of the ground being uncut.—**Chenille carpet,** a carpet in which the weft is of chenille instead of yarn. The pattern is dyed in the chenille itself, nothing showing at the surface of the carpet but the ends of the chenille fringe.—**Felt carpet,** a carpet in which the fibers are matted or felted together without spinning or weaving.—**Ingrain carpet,** a carpet made of wool dyed in the grain, or before it is manufactured. It is called *Scotch* or (in England) *Kidderminster*, from the place where it is made, and *two-ply* or *three-ply*, according to the number of webs composing the fabric.—**Paper carpet,** a floor-covering (plain or in imitation of ornamental woods) made of a hard and tenacious paper called *hession*, which is made by subjecting the paper-pulp to the action of chlorid of zinc and then to strong pressure, by which means the product is rendered hard and tough like leather.—**Persian carpet,** a carpet made in one piece, instead of in breadths or strips to be joined. The warp and weft are of linen or hemp, and the tufts of colored wool are inserted by twisting them around the warp all along the row according to the wearer's taste, no pattern being used. A line of tufts being inserted, a shoot of the weft is made, and then beaten up to close the fabric.—**Pile carpet,** a carpet made in the same way as Brussels carpet, but having its loops cut, thus forming a pile or soft surface.—**Printed carpet,** a carpet dyed or printed in colors; it is either woven in undyed colors and printed like calico, or the yarn is dyed in sections, which are adjusted according to their future position in the fabric.—**Scotch carpet.** Same as *ingrain carpet.*—**To be on the carpet** (more commonly *on the tapis*: see below), literally, to be on the table-cloth or table, as for consideration; hence, to be under discussion; be the subject of deliberation or of intended action: a translation of the French phrase *être sur le tapis* (*tapis*, table-cloth, carpet, etc.: see *tapestry*).—**Turkish** or **Turkey carpet,** a carpet similar to the Persian, distinguished by the selection of the tufts of colored wool according to the pattern followed, and the manner of their attachment to the back. The cutting of the yarn gives it the appearance of velvet.—**Venetian carpet,** a carpet with a warp or chain of worsted, generally arranged in different-colored stripes.—**Wilton carpet,** a variety of Brussels carpet in which the loops are cut open into an elastic velvet pile: so named from being made originally at Wilton in England.

Specifically—2. One who for hire undertakes the conveyance of goods or persons. The law distinguishes between *common carriers* and *private* or *special carriers*. One who carries not as a business, but only on occasion by special agreement, is termed a *private* or *special carrier*. One who holds himself out as a carrier, inviting the employment of the public generally, is a *common carrier*. The most familiar classes of common carriers are railroad companies, stage-coach proprietors, expressmen, truckmen, ship-owners, steamboat-lines, lightermen, and ferrymen. The special rules of liability which the law, for reasons of public policy, imposes on common carriers have not been applied in their full extent to the business of drovers, owners of tow-boats, log-drivers, and others who do not literally carry the property intrusted to them; nor are telegraph companies deemed common carriers in respect to the messages they transmit.

Cartesian (kär-tē′zi̤an), *a.* and *n.* [< F. *Cartésien* = Sp. Pg. It. *Cartesiano*, < *Cartesius*, Latinized form of *Cartes* in the name *Descartes* (*Des Cartes*), of which the first element is a removable prefix.] **I.** *a.* Pertaining to the French philosopher René Descartes (1596–1650), to his philosophy, or to his geometrical method. In order to put philosophy on a sound basis, Descartes professed to begin by doubting all things. But the doubt, the thought, could not be doubted; hence the fundamental proposition of his philosophy, *Cogito, ergo sum* (I think, therefore I am). This proposition (which is not a syllogism nor any formal mode of inference) means that, recognizing the fact that I think, I am irresistibly led to believe and clearly to discern that I exist, without being able to account for the inference. According to Descartes, the consideration that the conception of a deity involves the conception of a reality surpassing my own leads to the irresistible belief and clear perception of the existence of a God. Also, since veracity is an attribute of God, all that is clearly and distinctly apprehended must be true. This is the so-called *Cartesian criterion of truth*. Substances, he taught, are of two radically different kinds: the *material*, which are extended and not conscious, and the *spiritual*, which are conscious and not extended—a doctrine which is called *Cartesian dualism*. The *Cartesian doctrine of divine assistance*, or *occasionalism*, which was not fully developed by Descartes himself, is that whenever the soul makes a volition God intervenes to cause the corresponding motion of the body. He also taught that brutes are mere machines without consciousness (the *Cartesian automatism*), and that all space is filled with matter, which turns about in vortices, and so produces the motions of the heavenly bodies.—**Cartesian coördinates**, in *geom.*, the lines introduced (1637) by René Descartes for defining the positions of points in a plane. Two straight lines, OX and OY, are adopted arbitrarily as *axes of coördinates*, to which all positions are referred. Their point of intersection, O, is called the *origin of coördinates*. From any point, P, whose position is to be defined, a line, MP, is drawn parallel to OY, and meeting the axis OX in M. The length PM, or the *ordinate*, and the length OM, or the *abscissa*, being given, the position of P is determined; these lines are called the *Cartesian coördinates of the point P*. The term is sometimes extended to a similar system for three dimensions.—**Cartesian curve.** See II., 2.—**Cartesian devil, Cartesian diver,** or **bottle-imp**, a philosophical toy used to illustrate the principle of specific gravity. It consists of a hollow figure, usually in the fancied form of a demon, with a hole at some distance from the top. The figure is filled with air in the upper part and with water in the lower, and floats in a tall glass vessel nearly full of water and covered air-tight with india-rubber or a piece of bladder. When this cover is pressed down, the air underneath is compressed, and water enters the figure by the hole so as to bring the air within the figure to an equal degree of compression. The figure consequently sinks, and does not rise again until the pressure is removed.—**Cartesian geometry**, geometry treated by means of coördinates; analytical geometry. See *Cartesian coördinates*, above.—**Cartesian lens**, a lens so shaped that there is no spherical aberration; especially, a concavoconvex lens having one surface spherical and the other ellipsoidal. Such lenses were proposed by Descartes, but never successfully executed, and were shown later to be needless.—**Cartesian measure of force**, the measure of force as proportional to the velocity, founded on the observation that the same force is required to raise one pound two feet as to raise two pounds one foot. Owing to the confused notions of force of Descartes and his followers, it is impossible to say whether the principle as enunciated by them is correct or not; but its errors appear, at any rate, to have been corrected in the final development of the doctrine, though it is now superseded.—**Cartesian oval**, a curve, the locus of a point whose distances from two fixed points are connected by any given linear equation. A Cartesian oval is a real branch of a Cartesian curve. These ovals were first imagined by Descartes in connection with the theory of optics. The evolute of a Cartesian oval is the diacaustic of a circle.

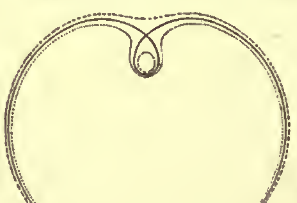
Confocal Cartesian Ovals.

F, F, F′ are the foci; the ovals *a* and *A* form one quartic curve, likewise *b* and *B*, *c* and *C*, *d* and *D*; *x* is the intermediate circle, *y* the orthogonal circle.

II. *n.* 1. One who adopts the philosophy of Descartes; a follower of Descartes.—2. Any curve of the fourth order having two cusps on the absolute. There are three genera of Cartesians. The first consists of curves of the sixth class, composed of a pair of Cartesian ovals, one inside the other. The second genus consists of curves of the fourth class, which are limaçons. Curves of this kind generally have an acnode which may become a crunode. The third genus consists of the cardioid, which is a curve of the third class with a real cusp. Every Cartesian has a single bitangent.—**Twisted Cartesian**, a curve in space, the locus of a point whose distances from three fixed points are connected by two linear equations.



Cartesians.

The full-line curve is a limaçon: without it and within the loop is a Cartesian of two ovals. On the other side of the limaçon is a Cartesian having only one real oval.

They support themselves by manual labor, mendicancy being forbidden. Their habit is a haircloth shirt, a white tunic, and, when out of doors, a black cloak and a cowl. The order was introduced into England about 1180, and built the Charterhouse (corruption of *Chartreuse*, used as the generic name of any Carthusian monastery) in London in 1371. The monks of Chartreuse now derive a considerable revenue from the sale of the well-known cordial, of their invention, which bears the name of the monastery. (See *chartreuse*, 2.) The Carthusian nuns originated about 1230, and, with some modifications, follow the rules of the Carthusian monks.

cartilage (kär′ti-la̤j), *n.* [< F. *cartilage* = Pr. *cartilage* = Sp. *cartilago* = Pg. *cartilagem* = It. *cartilagine*, < L. *cartilago* (*cartilagin-*), gristle; origin unknown.] A non-vascular animal tissue belonging to the connective-tissue group; gristle. Typical hyaline cartilage is a translucent substance, of firm elastic consistence, constructed of roundish cells embedded in a nearly homogeneous intercellular substance. Fibrocartilage differs in that the intercellular substance becomes fibrillated; it thus approaches ordinary connective tissue. Reticular, yellow, or elastic cartilage, as that constituting in man the epiglottis, the cornicula laryngis, the Eustachian tube, and gristly parts of the outer ear, contains interlacing elastic fibers in considerable quantity. In the two latter forms the homogeneous substance remains unchanged in the immediate vicinity of the cells, forming their hyaline capsules. Chondrin, a substance resembling gelatin, may be extracted from cartilage by boiling. Cartilage usually persists in parts of the skeleton of adult vertebrates, as on the articular ends of bones, in the thorax, and in various passages which require to be kept open, as the windpipe, nostrils, and ears.—**Alar cartilage.** See *alar*.—**Articular cartilage**, an incrustation of hyaline cartilage on the articular ends or surfaces of bones, not covered by perichondrium on its free surface, with a finely granular matrix and small cells, showing no tendency to ossify, its density, smoothness, and elasticity contributing to the free movement of the parts.—**Arytenoid cartilages**, two triangular pyramidal cartilages, seated, one on each side, on the summit of the posterior portion of the cricoid cartilage. To them are attached the posterior ends of the vocal cords.—**Cartilage of Wrisberg**, a small cartilage on either side in the aryteno-epiglottic fold. Also called *cuneiform cartilage*.—**Carti-**

lages of Santorini, the horns of the larynx, or cornicula laryngis, borne upon the arytenoid cartilages.—**Cellular cartilage,** a variety of cartilage of which the notochord chiefly consists, composed almost entirely of large cells with the intercellular matrix at a minimum.—**Circumferential cartilage,** an annular piece of fibrocartilage forming a rim around and deepening some articular cavity, as in the shoulder-joint or hip-joint.—**Connecting cartilage,** a kind of fibrocartilage occurring in joints of slight mobility or none, as the pubic symphysis, the sacroiliac synchondrosis, and the intervertebral articulations.—**Costal cartilage,** the piece of cartilage which prolongs the bony part of a rib to or toward the sternum; a hemapophysis; a sternal rib when unossified. In man all the ribs have costal cartilages; 7 of these reach the sternum, 3 are connected only with one another, and 2 form cartilaginous tips of the floating ribs.—**Cricoid cartilage,** the cricoid.—**Cuneiform cartilage.** Same as *cartilage of Wrisberg.*—**Dental cartilage,** the maxillary ridge (which see, under *maxillary*).—**Ensiform cartilage,** the xiphoid appendage of the sternum; the last segment of the sternum, or the xiphisternum when unossified, as in man.—**Fibrous cartilage,** cartilage mixed with inelastic white or elastic yellow fibrous tissue: usually called *fibrocartilage* (which see).—**Hyaline cartilage,** true or pure cartilage or gristle. It is of a pale-livid or pearly-bluish color, and consists of roundish cells embedded in a nearly homogeneous intercellular substance, that is, unmixed with fibrous tissue. The articular and costal cartilages, and the temporary cartilages of the fetal skeleton, are of this kind.—**Interarticular cartilage,** a meniscus; a cartilaginous discoidal, crescentic, annular, or otherwise shaped piece occurring free in the interior of certain joints, and consisting of fibrocartilage, such as the semilunar cartilages of the knee-joint. In man interarticular cartilages occur in the temporomaxillary, sternoclavicular, acromioclavicular, ulnocarpal, and femorotibial articulations.—**Interosseous cartilage,** a piece of interarticular cartilage.—**Meckel's cartilage.** See *Meckelian rod,* under *rod.*—**Palpebral cartilage.** Same as *tarsal cartilage.*—**Permanent cartilage,** that which remains unossified throughout life.—**Semilunar cartilage,** one of the pair of large, free, crescentic interarticular cartilages of the knee-joint. See cut under *knee.*—**Sesamoid cartilage,** one of several small lateral cartilages of the nose.—**Siphon-hinge cartilage,** in cephalopods, one of two cartilaginous sockets on either side of the funnel, into which fleshy knobs of the mantle-skirt are fitted.—**Stratiform cartilage,** a layer of fibrocartilage in an osseous groove along which a tendon glides.—**Tarsal cartilage,** a piece of fibrocartilage embedded in the eyelid, contributing to preserve its shape. Also called *palpebral cartilage.*—**Temporary cartilage,** that cartilage which is replaced by bone in the process of ossification.

An oval or oblong figure on ancient Egyptian monuments and in papyri, containing groups of characters expressing the names or titles of royal personages and, rarely, of deities: a name given by Champollion. The cartouche does not occur in connection with the appellations of the earliest rulers of Egypt, but first appears with those of the twenty-second king of the monumental list. By extension it now commonly signifies both the inclosing ring and its contents. From the beginning of the twelfth dynasty an Egyptian king at the moment of coronation assumed, in addition to his family or personal name, an official, regal, or throne name, which took its place beside the former, generally preceding it, and thus gave occasion to a double cartouche. In imitation of the German *schilde* employed in a heraldic sense, the cartouche is in English sometimes styled a *shield* or *escutcheon,* or more often merely an *oval.*

The bolster or cross-beam which directly supports the car-body is in the middle of the framework, and is suspended from it by equalizing bars and suspension-straps, in such a way as to distribute the weight upon all the wheels and allow for the sway, or freedom of motion, essential to easy riding. > Information from the same source [Statistical Account of Scotland] also explains the use of the word *caruca* for plough. For the construction of the word involves not 4 yoke of oxen, but 4 oxen yoked abreast, as are the horses in the *caruca* so often seen upon Roman coins. And the "statistical account" informs us that in some districts of Scotland in former times "the ploughs were drawn by 4 oxen or horses yoked abreast; one trod constantly upon the tilled surface, another went in the furrow, and two upon the stubble, or white land. Also *carue.*

> A trace at least of the original reason of the varying contents and relations of the hide and virgate is to be found in the Hundred Rolls, as, indeed, almost everywhere else, in the use of another word in the place of hide, when, instead of the anciently assessed hidage of a manor, its more modern actual taxable value is examined into and expressed. This story is probably imaginary, but no doubt the name and perhaps the idea of the caryatids were derived from Caryæ.

The soft pith abounds in sago-like farina, which is made into bread or eaten as gruel. In this sense *case* is nearly synonymous with *cause*, which is the more technical term. *Case* includes special proceedings, as well as actions at law, suits in equity, and criminal prosecutions; and it implies not only a controversy, but also legal proceedings. More loosely, however, it is used for cause of action: as, he has a good *case.*

6. In *gram.*, in many languages, one of the forms having different offices in the sentence which together make up the inflection of a noun: as, the *nominative case*, that of the subject of the verb, as *he*, *dominus* (Latin); the *accusative* or *objective case*, as *him*, *dominum*; the *genitive* or *possessive case*, as *his* (John's), *domini.* These are the only cases in modern English, and the objective is not distinguished in form from the nominative except in a few pronouns. In addition to the three cases found in English, Greek and German have a dative, Latin has a dative, an ablative, and a vocative, and Sanskrit further an instrumental and a locative. The French has lost all case-distinction in nouns. Some languages, as the Finnish and Hungarian, have many more cases, even fifteen or twenty. All the cases but the nominative are called *oblique cases.*

7. A person who is peculiar or remarkable in any respect: as, a queer *case*; a hard *case*: sometimes used without qualification: as, he is a *case.* [Colloq.]

> "Well, the General can tell you," says the hunter, glancing at that individual, "what a terrible hard *case* I've been." *W. M. Baker*, New Timothy, p. 114.

8. In *logic*, a proposition stating a fact coming under a general rule; a subsumption.—**Action on the case**, in *law*, a general form of action (the phrase being originally equivalent to *action on the circumstances*) adopted to enlarge the legal remedies at a time when forms of action existed for trespasses with violence and for debts resting in bond, but no form had been provided for wrongs without violence, such as negligence, or oral or implied promise. It became the most widely used of all common-law forms, and equally applicable to consequential injury to the real or personal property and to the personal character of the party by whom it was brought. —**Amistad case**, a noted case in the courts of the United States, in which Spaniards claimed as their slaves negroes who had been kidnapped in Africa, and who while being carried to Cuba (in 1839) rose against their captors, took possession of the vessel, and after changing her course were taken by a United States vessel off the American coast. The courts held that they were free, and not pirates or robbers.—**Bankers' case,** or **case of the bankers,** the petition of Hornblee and others to the barons of the exchequer in 1691 (14 How. St. Tr., 1) for the payment of certain annuities granted by Charles II. to repay money originally loaned to him on the security of the revenues. On appeal, the House of Lords decided that the grant was binding upon his successor, and continued a charge upon the revenue.—**Bates's case,** an English prosecution (1606) of a merchant, in which the claim of James I. to impose duties as a personal prerogative was sustained; a question afterward settled the other way under Cromwell. Also called the *case of the impositions.*—**Bradlaugh's case,** a prolonged controversy (1881–86) over the claim of Charles Bradlaugh (*a*) to take a seat in the House of Commons without taking the oath required of members, he declaring that he did not acknowledge or believe in its obligation; and later (*b*) to have the oath administered. Two notable legal decisions were reached in the course of the controversy. In 1884 (12 Law Rep., Q. B. D., 271), in the case of Charles Bradlaugh *v.* Francis R. Gossett, sergeant-at-arms of the House of Commons, arising out of a resolution excluding plaintiff from the House until he should engage not to disturb its proceedings by demanding to take the oath as a member, it was held that courts cannot control the House in its administration of laws relating merely to its internal procedure, nor inquire into the propriety of a resolution restraining a member from doing in the House what he had a lawful right to do, and that action will not lie against the sergeant-at-arms for obeying such resolution. In 1885 (14 Law Rep., Q. B. D., 667), in the Court of Appeal, the case of the Attorney-General *v.* Bradlaugh, for penalties under the Parliamentary Oaths Act, for voting in the House without having been sworn as a member, it was decided that a member who does not believe in a Supreme Being, and upon whom an oath is binding only as a promise, is incapable of taking the prescribed oath; but if he goes through the form of taking it (as Bradlaugh did by administering the oath to himself at the bar of the House), he is liable for violation of the act.—**Burr's case,** the prosecution of Aaron Burr for treason against the United States, tried before Chief Justice Marshall in 1807.—**Calvin's case,** also called the *case of the postnati*, 1608 (2 How. St. Tr., 559; 7 Coke, 1), an action turning on questions of allegiance and natural-born subjects. It was brought to recover lands by Robert Calvin against Richard and Nicholas Smith, to which defendants pleaded that the plaintiff was an alien, and incapable of bringing the action, because he was born in Scotland, though after the crown of England descended to James I., who was also king of Scotland. It was argued by lawyers and judges of the greatest renown, including Lords Bacon, Coke, Ellesmere, Yelverton, and Warburton, and was decided in favor of the plaintiff.—**Case agreed,** or **case stated,** in *law*, a statement of facts agreed on by the parties, or made by another court, to be submitted merely for decision of a point of law.—**Case law.** See *law.*—**Case of conscience.** See *conscience.*—**Case of the Caroline,** a name given to the case of the People *v.* McLeod. It was held that an act of Parliament which is against common right and reason, or is impossible to be performed, is void by the common law; also, that where the power to commit to prison is vested by patent or act of Parliament in parties not being a court, their proceedings ought to be of record, and the facts upon which such power is exercised are traversable.—**Dred Scott case,** a case of great historical importance among the events which preceded the abolition of slavery in the United States, in which the Supreme Court held (in 1857) that a free negro of slave ancestry was not a citizen, and could not sue or be protected as such in the United States courts. The statement that the Africans in America had long been considered a subordinate race having "no rights which the white man is bound to respect," which was contained in the opinion of the chief justice, gained universal attention as a point of attack in the controversy about slavery.—**Five per cent. cases,** a decision of the United States Supreme Court in 1884 (110 U. S., 471), holding that an act of Congress by which a percentage of the proceeds of land "sold by Congress" is reserved to certain public uses of a State does not include lands disposed of by the United States in satisfaction of military land-warrants.—**General case,** in *math.*, that special state of things which is considered when, in studying an analytical expression, it is assumed that there is no peculiar relation between the constants denoted by letters. The general case may be very exceptional. Thus, in linear associative algebra, in the general case the vanishing of a product implies the vanishing of one of the factors, yet among the innumerable possible algebras there are but three in which such an inference is valid.—**Hampden's case.** See *case of ship-money*, under *ship-money.*—**In case,** in the event or contingency; if it should so fall out or happen that; supposing.

> A sure retreat to his forces, *in case* they should have an ill day or an unlucky chance in the field.

McLeod was arrested as one of the attacking party, and was indicted (1841) in New York State for murder; but he proved an alibi, and was acquitted. Also called the *case of the Caroline.*—**Negro case.** See *Sommersett's case*, below.—**Shelley's case,** the decision in 1581 (1 Coke, 89–106), by all the judges of England, of the case of Nicholas Wolfe against Henry Shelley, in ejectment, involving questions upon the law of common recoveries. It is chiefly celebrated for a precise and clear statement by defendant's counsel of a previously well-established rule of law concerning the effect of the word "heirs" in certain conveyances, since known as the rule in Shelley's case. This rule, which is now regarded as a rule of interpretation rather than a rule of law, is to the effect that wherever there is a limitation to a man, which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions), either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate; that is to say, not a gift to the heir, but a gift to the person first named of an estate of inheritance, such as his heir may take by descent.—**Sommersett's case,** a famous habeas corpus case in England in 1772, before Lord Mansfield, brought on behalf of Thomas Sommersett, a negro. It established the principle that a slave brought upon English soil became thereby free. Also called the *negro case.*—**Special case,** a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing on the facts so stated. In Scots law, in civil jury causes, a special case differs from a special verdict only in this, that the special verdict is returned by the jury, whereas the special case is adjusted by the parties themselves, or by their counsel, and sets forth the special facts on which they are agreed without the evidence.—**Taltarum's case,** a noted decision in the English courts in 1473, establishing the power of a tenant in tail to convert the estate into a fee simple absolute by suffering a common recovery.—**Tennessee bond cases,** a name given to seventeen causes decided by the United States Supreme Court in 1885 (114 U. S. Sup. Ct., 663), wherein it was held that the statutory lien upon railroads created by act of the Tennessee Legislature, Feb. 11th, 1852, was for the benefit of the State, and not of the holders of State bonds issued under that act.—**Tichborne case,** also called the *case of the claimant*, the name given to the history and proceedings of Thomas Castro, otherwise Arthur Orton, in his claim to be Sir Roger Tichborne, and heir to the estate and baronetcy of Tichborne in England (1868–74), which he prosecuted by suits in Chancery and in the Courts of Probate and of Common Pleas, and which culminated in his trial and sentence to fourteen years' imprisonment for perjury. The case is celebrated for the conflicting nature of the testimony as to his identity, and for the great public interest excited by it.—**To put the case,** to suppose the event or a certain state of things; state a question, especially in a manner to invite decision.—**Tweed's case,** the proceedings against William M. Tweed and others, known as the Tweed Ring, for frauds perpetrated while they were municipal officers of New York, by which they obtained over six million dollars from the county of New York. In a civil case it was decided by the Court of Appeals of New York in 1874 (People *v.* Ingersoll, 58 N. Y., 1) that an action for money fraudulently obtained from a county could not be brought in the name of the people of the State. This was subsequently remedied by statute, and a judgment obtained. In a criminal case, Tweed was found guilty on twelve counts for similar offenses in one indictment, and was separately sentenced to one year's imprisonment on each, with the direction that service of one sentence should not begin until the completion of service on a prior sentence. After completing the term of his first sentence, a writ of habeas corpus was served on his jailer, and the Court of Appeals in 1875 (People ex rel. Tweed *v.* Liscomb, 60 N. Y., 559) decided that, under the statutes conferring the power to sentence, cumulative sentences in such cases were not lawful, and discharged him; but he was immediately imprisoned in default of bail in preceding civil suits. Other minor decisions on questions of procedure are also included under this term.—**Twyne's case,** the leading case in English law (1603) holding that a conveyance intended to defraud creditors is void as against them, if not taken in good faith and for valuable consideration.—**Tyrrel's case,** a noted decision in English law (1558), in which after Parliament, by the statute of uses, had thought to put an end to the holding of land in the name of one person to the use of another, the courts introduced the doctrine of a use upon a use, leading to the present law of trusts.—**Virginia coupon cases,** the generic name under which are known a number of suits determined by the United States Supreme Court in 1884, enforcing a Virginia statute which declared coupons on bonds of that State receivable in payment of State taxes, notwithstanding the repeal of that statute.—**Wheeling bridge case,** the case of Pennsylvania *v.* Wheeling and Belmont Bridge Co., decided by the United States Supreme Court (in 1851 and 1855), concerning a railroad bridge across the Ohio river at Wheeling, Virginia. After holding in 1851 (13 How., 518), by a divided court, that a bridge, though entirely within the jurisdiction of the State that authorized its construction, could be enjoined as a nuisance by the courts of the United States if it obstructed inter-state navigation, the court held in 1855 (18 How., 421) that Congress, under the constitutional power to regulate commerce between the States, may determine what shall or shall not be deemed an obstruction to navigation, and may declare a bridge, when erected, to be a lawful structure so as to avoid the effect of its having been judicially declared a nuisance.—**Wild's case,** an English decision, in 1599 (6 Co. Rep., 16 b), in the case of Richardson *v.* Yardley, in ejectment: so called because involving a devise to one Rowland Wild, which established the rule for the construction of wills known as the rule in Wild's case, viz., "that if A devises his lands to B and his children or issues, and he hath not any issue at the time of the devise, that the same is an estate tail."=**Syn.** Situation, condition, state, circumstances, plight, predicament.

The ordinary case is about 16 inches wide, 32 inches long, and has boxes 1 inch deep. Two forms of case are required for a full font of Roman type: the *upper case* (so called from its higher position on the inclined composing-frame), of 98 boxes, which contains the capitals, small capitals, reference-marks, fractions, and other types in small request; and the *lower case*, of 55 boxes of unequal size, which contains the small-text types, spaces, and points most frequently required. The cases and boxes are arranged so that the types oftenest used are most easily reached by the compositor. Cased glass, glass made in several layers, usually of different colors, by cutting through which to different depths an effect like that of cameo is produced. The ancient Roman glass of this kind was cut by hand in the manner of gem-cutting. The process in use at the present day consists in covering the outside of a colorless glass ball with a thin case of colored glass, and fusing the two together, repeating the operation as often as desired; the whole is then blown into the shape required before the cutting is done. The principal castes are four in number: 1st, the Brahmans, or the sacerdotal caste; 2d, the Kshatriyas, modern Rajputs, or military caste; 3d, the Vaisyas, or husbandmen and merchants, who have now in many districts become merged in the second and fourth castes; 4th, the Sudras, or laborers and mechanics. The Brahmans are supposed to have sprung from the mouth of Brahma, the Kshatriyas from his arms, the Vaisyas from his belly and thighs, and the Sudras from his feet. The Brahman represents religion; the Kshatriya, war; the Vaisya, commerce and wealth; and the Sudra, labor. There are many subdivisions of caste, and although the Sudras are degraded far below the Brahmans, Kshatriyas, and Vaisyas, there are reckoned thirty-six subdivisions lower than the Sudras. Lowest of all are the Pariahs, who are supposed to be of no caste, and mere outcasts from humanity. Of the castes, the first three are the natural and gradually established divisions of the Aryan invaders and conquerors of India; the fourth was made up of the subjugated aborigines. The Sanskrit name for caste is *varna*, color, the different castes having been at first marked by differences of complexion, according to race, and in some degree according to occupation and consequent exposure. Besides the original castes, numerous mixed classes or castes have sprung up in the progress of time, and are dependent upon trade, occupation, or profession; in fact, the essential principle in the system of caste is the confining of employments to hereditary classes. Castes are, according to Indian social standards, either "high" or "low." The same term is also used of somewhat similar classes in other countries.

> The system of *caste* involves the worst of all wrongs to humanity—that of hallowing evil by the authority and sanction of religion. *Faiths of the World*, p. 30.

> To be subjugated by an inferior *caste* was a degradation beyond all other degradation. *Macaulay*, Hist. Eng.

> Offensive as is the *low-caste* Indian, . . . I had rather see the lowest Pariahs of the low, than a single trim, smooth-faced, smooth-wayed, clever *high-caste* Hindoo on my lands or in my colony.
> *W. G. Palgrave*, in Fortnightly Rev.

Hence—**2.** A division of society, or the principle of grading society, according to external conditions; a class or grade separated from others by differences of wealth, hereditary rank or privileges, or by profession or employment.

> Where the operations became hereditary, a system of *castes* arose. This system has never been rigid in Western Europe, however, as it has been in India and other countries of the East.
> *D. W. Ross*, German Land-holding, Notes, p. 134.

> Her manner had not that repose
> Which stamps the *caste* of Vere de Vere.
> *Tennyson*, Lady Clara Vere de Vere.

> The spirit of *caste* morally tortures its victims with as much coolness as the Indian tortures his enemy.
> *H. Spencer*, Social Statics, p. 221.

Castles, in the sense of fortified residences, were an outgrowth or institution of feudalism, and were first brought to a high pitch of strength and completeness by the Normans. In England there were few or no castles, properly speaking, till the time of William the Conqueror, after which a great many were constructed on the Norman model. At first the donjon or keep was the only part of the castle of great strength, and the other buildings in connection with it were of a more or less temporary nature. In the thirteenth century, however, the design of the castle became more fully developed, and the keep formed only the central part of a group of buildings, all supporting one another, and mutually contributing to the strength and commodiousness of the whole. The cut shows the castle of Coucy, near Laon, France, built in the thirteenth century. In the foreground is the outer bailey or esplanade, fortified, and containing a chapel, stables, and other buildings. The outer entrance to this was formed by a barbican or antemural (see plan under *antemural*). *a* is the foss, 20 yards broad; *b*, the gate, approached by two swing-bridges, defended by two guard-rooms, and having a double portcullis within, giving entrance to vaulted guard-rooms with sleeping-apartments, etc., above, *c*; *d*, inner bailey or courtyard; *e*, covered buildings for the men defending the walls or curtains; *f*, apartments for the family, entered by the grand staircase, *g*; *h*, great hall, with storerooms and vaults below; *i*, donjon or keep (the chapel is seen behind it), the strongest part of the castle, with walls of immense thickness, suited to form the last retreat of the garrison. At *k* is a postern leading from the donjon and communicating with an outer postern, drawbridge, etc.; *l, m, n, o* are the chief towers flanking the outer walls.

2. In *her.*, a representation of two or more towers connected by curtains, often having a gateway in one of the curtains, and always embattled. When the towers are represented with the windows and the joints between the stones of colors different from that of the wall, they are said to be masoned or windowed *gules, or*, or the like. When the windows are shown of the color of the field, the castle is said to be *voided of the field*, or sometimes *ajouré*. The door is called the *port*; if it has a portcullis, this and its color are mentioned in the blazon.

3. The house or mansion of a person of rank or wealth: somewhat vaguely applied, but usually to a large and more or less imposing building.—**4.** A piece made in the form of a castle, donjon, or tower, used in the game of chess; the rook. —**5.** A kind of helmet.—**6.** *Naut.*, a kind of fighting-tower formerly erected on war-galleys, etc., near the bow and stern, and called respectively *forecastle* and *aftcastle*. See cut under *cadenas*.—**A castle in the air, or in Spain**, a visionary project; a vague imagination of possible wealth, fame, happiness, or the like; a day-dream. (See below.)—**To build castles in Spain**, to build castles in the air. (See below.) The origin of this phrase (which is traced back in French literature to the thirteenth century, and in English to the fourteenth) is doubtful. It has been attributed to the boasting by Spanish adventurers in France of their lordly residences, which existed only in their imaginations; and less probably to a supposed prohibition at some time against the erection of fortifications in Spain. Littré thinks the idea is simply that of an imaginary castle in any foreign country, other names having been similarly used, and that of Spain prevailing as most familiar; to which may be added that its real origin is probably to be found in the notion, always prevalent, of the attainment of great wealth through emigration or foreign adventure.

> Thou shalt make *castels* thanne *in Spayne*,
> And dreme of joye, alle but in vayne.
>

There are, however, several fossil genera, as *Eucastor* and *Steneofiber*, and probably others. The oil that first comes away, called *cold-drawn castor-oil*, is reckoned the best; an inferior quality is obtained by heating or steaming the pressed seeds, and again subjecting them to pressure. The oil is afterward heated to the boiling-point, in order to separate the albumen and impurities. Castor-oil is used medicinally as a mild but efficient purgative. It is also used as a fixing agent in cotton-dyeing, especially in dyeing a Turkey-red color from madder. In its saponified state it is sold under various names, as *Turkey-red oil*, *alizarin oil*, *sulphated oil*, *soluble oil*, etc.—**Castor-oil plant**, the plant *Ricinus communis*, which produces castor-oil. Casual ejector, in *law*, the name given to the defendant in the fictitious action of ejectment formerly allowed by the common law, where the real object of the action was to determine a title to land. To form the ground of such an action, the person laying claim to the land granted a lease of it to a fictitious person, usually designated John Doe, and an action was then brought in the name of John Doe against another fictitious person, usually designated Richard Roe (the casual ejector), who was stated to have illegally ejected John Doe from the land which he held on lease. The landholder was permitted to defend in place of Richard Roe, and thus the determination of the action involved the proving of the lessor's right to grant a lease. They consist of a labyrinth of narrow galleries, from 4 to 5 feet wide, at different levels, excavated in the soft granular tufa underlying the Campagna. In each wall loculi, or berth-like recesses, contained the bodies of the dead. The entrances to these were closed with slabs of stone, carefully sealed, and marked with inscriptions or rude pictures. In some cases small rooms, called *cubicula*, were set apart for families of distinction in the church, especially for martyrs. Though

these catacombs probably served to some extent as places of refuge and concealment for Christians during the earlier persecutions, the original idea of their construction was undoubtedly that they should be used only as burial-vaults. The length of the galleries in the Roman catacombs has been variously estimated at from 350 to 900 miles, and the number of bodies there interred is said to be over 6,000,000. Similar underground burial-places are found at Naples, Cairo, Paris, etc. Those of Paris are abandoned quarries extending under a large portion of the city, which were made into a bonery in 1786, when the intramural cemeteries of the city were condemned and the bones were removed thither.

Catapult.

> Its construction is nowhere explained with any fullness, and it is uncertain whether its action was that of a crossbow or whether springs were the propelling power. By later authors the catapult and ballista seem to be confounded. In the middle ages the name is hardly used, except where a writer is evidently seeking to give a classical form to his composition. In the annexed cut, which represents a catapult of the later period when no distinction was made between it and the ballista, *F* is the end of a strong lever, which revolves on an axis and is held down by a windlass, *A*. At the extremity is a fork, *E E*, with the prongs curving slightly upward so as to afford a bed for a barrel of combustible matter or a heavy missile confined by a rope with a loop at the end, the loop being passed through a hook, *D*. When the lever was released it bounded suddenly upward, the centrifugal force causing the loop *C* to slip off the hook, whereupon the barrel held on the fork was liberated and projected toward its object. *B* shows rings of iron, stone, or lead, intended to increase the rebound due to the stretched cables or other devices which furnished the propelling force.

> Bring up the *catapults*, and shake the wall.
> *Fletcher*, Bonduca, iv. 4.

> All the bombards and *catapults*, and other engines of war, thundered furiously upon the city, doing great damage.

3. A disease of the eye, characterized by opacity of the lens. It is produced in various ways, often as a senile change, being then a sclerosis of the lens. *Capsular cataracts*, so called, do not involve an opaqueness of the capsule of the lens itself, but of that part of the lens which is next to the capsule, or are due to a deposit of opaque matter externally upon the capsule. A *secondary cataract* is one due to an earlier disease of the eye. Cataracts are probably incurable except by surgical treatment. The lens is commonly entirely removed by an incision into the eye, or it is broken up with a fine needle and left to be absorbed.

In such a series each state differs from the preceding in exhibiting greater stability, less complexity, and less contained energy. The corresponding term regarding an anabolic process is *anastate*. The arrangement of actions or interconnection of causes which constitutes the final event of a dramatic piece; the unfolding and winding up of the plot, clearing up difficulties, and closing the play; the dénouement. The ancients divided a play into the protasis, epitasis, catastasis, and catastrophe; that is, the introduction, continuance, heightening, and development or conclusion.

Pat, he comes, like the *catastrophe* of the old comedy.
Shak., Lear, i. 2.

2. A notable event terminating a connected series; a finishing stroke or wind-up; specifically, an unfortunate conclusion; hence, any great calamity or disaster, especially one happening suddenly or from an irresistible cause.

W. Phillips, Speeches, p. 6.

3. In *geol.*, an occurrence of geological importance not in harmony with preceding events, and not the result of causes acting always in a given direction; a cataclysm. It was once generally believed that the earth has "undergone a succession of revolutions and aqueous *catastrophes* interrupted by long intervals of tranquillity" (*Lyell*). The deluge was one of these great catastrophes. A similar view is the once common idea that all the living organisms on the earth's surface had been again and again exterminated, to be succeeded by new creations of plants and animals.

Great changes of a kind and intensity quite different from the common course of events, and which may therefore properly be called *catastrophes*, have taken place upon the earth's surface.
Whewell.

The old notion of all the inhabitants of the earth having been swept away by *catastrophes* at successive periods is very generally given up, even by those geologists, as Élie de Beaumont, Murchison, Barrande, etc., whose general views would naturally lead them to this conclusion.
Darwin, Origin of Species, p. 299.

The hypothesis of uniformity cannot possess any essential simplicity which, previous to inquiry, gives it a claim upon our assent superior to that of the opposite *catastrophic* hypothesis.
Whewell.

3. Subversive in a momentous degree of settled usage or law.

The *catastrophic* creation of Peers for the purpose of swamping the upper house is . . . a power only to be used on great occasions, when the object is immense, and the party strife unmitigated.

catastrophism (ka-tas′trọ̄-fizm), *n.* [< *catastrophe* + *-ism*; = F. *catastrophisme*.] The theoretical view of geological events which has as its essential basis the idea of a succession of catastrophes: the opposite of *uniformitarianism*. See *catastrophe*, 3, and *cataclysm*, 2.

I find three, more or less contradictory, systems of geologic thought, each of which might fairly enough claim these appellations, standing side by side in Britain. I shall call one of them *Catastrophism*, another Uniformitarianism, the third Evolutionism. By *Catastrophism*, I mean any form of geological speculation which, in order to account for the phenomena of geology, supposes the operation of forces different in their nature, or immeasurably different in power, from those which we at present see in action in the universe.
Huxley, Lay Sermons, p. 229.

catastrophist (ka̤-tas′trọ̄-fist), *n.* [< *catastrophe* + *-ist*.] One who believes in catastrophism; a cataclysmist. The term is used in geology by writers on theoretical dynamic geology as the opposite of *uniformitarian*, that is, of one who considers that geological causes now in action are, and have been, essentially the same from the beginning. The catastrophist maintains that there have been catastrophes, or sudden violent changes in the order of nature, such, for instance, as would cause the extermination of all forms of life upon the globe, or cover it with ice.

The *catastrophist* is affirmative, the uniformitarian is negative in his assertions.
Whewell.

For a generation after geologists had become uniformitarians in Geology, they remained *catastrophists* in Biology.

> *Milton*, Comus, l. 953.

Catch me! (catch him! catch her!) an emphatic phrase meaning that there is no likelihood or possibility of one's doing something suggested: as, Will you lend him the money? *Catch me!* [Colloq.]—**Catch the ten,** a game of cards common in Scotland, so named from the desirability of catching the ten of trumps, which counts 10 and can be taken by any honor-card. The game resembles whist, except that the knave counts 11, the ace 4, the king 3, and the queen 2; it is played with 36 cards, all below the six-spot being thrown out, and 100 points make game.—**First catch your hare,** a direction occurring in later editions of the well-known cookery-book attributed to Mrs. Glasse, and used as an aphorism to the effect that, before disposing of a thing, you ought to make sure of the possession of it. In reality the saying arose from a misprint, *catch* being an error for *case*, in the sense of to skin. Properly, therefore, the direction is, "First *case* (skin) your hare," etc. See *case*^{2}, *v. t.*—**To catch a crab.** See *crab*^{1}.—**To catch a Tatar.** See *Tatar.*—**To catch hold of,** to take or lay hold of.—**To catch it,** to get a scolding, a beating, or other unpleasant treatment or experience. In *logic*, a highest notion, especially one derived from the logical analysis of the forms of proposition. The word was introduced by Aristotle, who applies it to his ten predicaments, things said, or summa genera, viz., substance, quantity, quality, relation, action, passion, where, when, posture or relative position of parts, habit or state. These are derived from such an analysis of the proposition as could be made before the developed study of grammar. The *categories* or highest intellectual concepts of Kant are: *categories of quantity*—unity, plurality, totality; *categories of quality*—reality, negation, limit between these; *categories of relation*—substance and accident, cause and effect, action and reaction; *categories of modality*—possibility, impossibility, actuality, non-actuality, necessity, non-necessity. Modern formal logic furnishes this list: (1) qualities, or singular characters; (2) simple relations, or dual characters; (3) complex relations, or plural characters. Many lists of categories have been given not founded on formal logic.

The *categories*, or forms and conditions of human understanding, though doubtless innate in the naturalist's sense of the term, that is inherited, are only the ways and facilities of the higher exercise of the faculty of reflection.
C. Wright.

> The importunity of heretics made them [the Church of Christ] add another name to this [Christian], viz., that of *catholic*; which was, as it were, their surname or characteristic, to distinguish them from all sects, who, though they had party names, yet sometimes sheltered themselves under the common name of Christians. *Bingham*, Antiq., I. i. § 7.

(*b*) A reform party in the Roman Catholic Church, founded after the proclamation of, and in opposition to, the dogma of papal infallibility proclaimed by the Vatican Council in 1870. A schism with the Roman Catholic Church was not intended, but it resulted; the leaders were excommunicated and new congregations formed. No bishop having joined the movement, the ordination of a bishop was obtained from the Old Catholic bishop of Deventer in Holland. Old Catholics have departed in few respects from their former ecclesiastical customs as Roman Catholics. Auricular confession and fasting are, however, voluntary with them, and priests are allowed to marry. Mass is permitted to be said in the vernacular. caucus (kâ′kus), *n.* [This word originated in Boston, Massachusetts. According to a common account it is a corruption of *calkers' meeting*, a term said to have been applied in derision by the Tories to meetings of citizens, among whom were calkers and ropemakers, held to protest against the aggressions of the royal troops, and especially against the "Boston Massacre" of March 5th, 1770. But such a corruption and forgetfulness of the orig. meaning of a word so familiar as *calkers* is improbable, and, moreover, the word *caucus* occurs at least 17 years earlier, in the following passage in the diary of John Adams: "Feb. . . ., 1753—This day found that the *Caucus* Club meets at certain times in the yard of Tom Dawes, adjutant of the Boston (militia) regiment." This indicates the origin of the term *caucus*, as a private meeting for political purposes, in the name of a club of that nature, called the "Caucus Club." The origin of the name as applied to the club is not known, but if not an arbitrary term, chosen for its alliterative form and feigned mysterious import, it may have been a learned adoption, in allusion to the convivial or symposiac feature of the club, of the ML. *caucus*, < MGr. καῦκος (also καύκη, καῦκα, with dim. καυκίον), a cup.] 1. In *U. S. politics*: (*a*) A local meeting of the voters of a party to nominate candidates for local offices, or to elect delegates to a convention for the nomination of more important officers. (*b*) A similar congressional, legislative, or other gathering of leading members of a party for conference as to party measures and policy. Candidates for the presidency and vice-presidency of the United States were nominated by party caucuses of members of Congress from 1800 to 1824.

More than fifty years ago, Mr. Samuel Adams's father, and twenty others, one or two from the north end of the town, where all the ship business is carried on, used to meet, make a *caucus*, and lay their plans for introducing certain persons into places of trust and power.
Gordon, Hist. of the Revolution, 1788.

A *caucus* (excuse the slang of politics) was held, as I am informed, by the delegations [of three Western States] for the purpose of recommending some character to the President [for Judge of Supreme Court].

See *accuse*, *excuse*.] **1.** That by the power of which an event or thing is; a principle from which an effect arises; that upon which something depends per se; in general, anything which stands to something else in a real relation analogous to the mental relation of the antecedent to the consequent of a conditional proposition. Nominalist philosophers commonly hold that every effect is the result not of one but of many causes (see *total cause*, below); but the usual doctrine is that the effect is an abstract element of a thing or event, while the cause is an abstract element of an antecedent event. Four kinds of causes are recognized by Aristotelians: the *material*, *formal*, *efficient*, and *final cause*. *Material cause* is that which gives being to the thing, the matter by the determination of which it is constituted; *formal cause*, that which gives the thing its characteristics, the form or determination by which the matter becomes the thing; *efficient cause*, an external cause preceding its effect in time, and distinguished from *material* and *formal cause* by being external to that which it causes, and from the end or *final cause* in being that by which something is made or done, and not merely that for the sake of which it is made or done; *final cause*, an external cause following after that which it determines (called the *means*), the end for which the effect exists. Other divisions of causes are as follows: *subordinate* or *second cause*, one which is itself caused by something else; *first cause*, that which is not caused by anything else; *proximate* or *immediate cause*, one between which and the effect no other cause intervenes, or, in *law*, that from which the effect might be expected to follow without the concurrence of any unusual circumstances; *remote cause*, the opposite of *proximate cause*; *total cause*, the aggregate of all the antecedents which suffice to bring about the event; *partial cause*, something which tends to bring about an effect, but only in conjunction with other causes; *emanative cause*, that which by its mere existence determines the effect; *active cause*, that which brings about the effect by an action or operation, termed the *causation*; *immanent cause*, that which brings about some effect within itself, as the mind calling up an image; *transient cause*, that whose effect lies outside itself; *free cause*, that which is self-determined and free to act or not act: opposed to *necessary cause*; *principal cause*, that upon which the effect mainly depends; *instrumental cause*, a cause subservient to the principal cause. The above are the chief distinctions of the Aristotelians. The physicians, following Galen, recognized three kinds of causes, the *procatarctic*, *proëgumenal*, and *synectic*. The *procatarctic cause* is an antecedent condition of things outside of the principal cause, facilitating the production of the effect; the *proëgumenal cause* is that within the principal cause which either predisposes or directly excites it to action; and the *synectic*, *containing*, or *continent cause* is the essence of the disease itself considered as the cause of the symptoms; thus typhoid fever might be referred to as the *continent cause* of ocher-stools or a quickened pulse. Other varieties are the *occasional cause* (see *occasionalism*); *moral cause*, the person inciting the agent to action; *objective cause*, the ideas which excite the imagination of the agent; and *sufficient cause*, one which suffices to bring about the effect (see *sufficient reason*, under *reason*).

> *T. H. Green*, Prolegomena to Ethics, § 74.

> *Cause* is the condensed expression of the factors of any phenomenon, the effect being the fact itself.
> *G. H. Lewes*, Probs. of Life and Mind, II. v. § 19.

> Of these two senses of the word *cause*, viz., that which brings a thing to be, and that on which a thing under given circumstances follows, the former is that of which our experience is the earlier and more intimate, being suggested to us by our consciousness of willing and doing.
> *J. H. Newman*, Gram. of Assent, p. 65.

Specifically—**2.** An antecedent upon which an effect follows according to a law of nature; an efficient cause. The common conception of a cause, as producing an effect similar to itself at a later time and without essential reference to any third factor, is at variance with the established principles of mechanics. Two successive positions of a system must be known, in addition to the law of the force, before a position can be predicted; but the common idea of a cause is that of a single antecedent determining a consequent of the same nature. Moreover, the action of a force is strictly contemporaneous with it and comes to an end with it; and no known law of nature coördinates events separated by an interval of time.

The genus comprises a vast number of minute, slender-bodied midges, which are of special interest on account of their mode of life, the peculiar structure exhibited in the larvæ, and the economic importance attached to several species. In most cases the female lays her eggs in the stems, leaves, or buds of various plants, producing gall-like excrescences of various forms, inhabited by the larvæ. These are subcylindrical, legless grubs, mostly of a reddish or yellow color, and are furnished on the ventral side of the thoracic joints with a corneous plate, usually forked, called the breast-bone. Some species, however, do not produce galls, and among these the most familiar are the Hessian-fly and the clover-seed midge, *C. leguminicola* (Lintner), which latter infests the seeds of clover, causing great damage in the more northern parts of the United States. See also cut under *fly*².

8. In *elect.*, a single jar or element of a voltaic battery. A *simple cell* ordinarily consists of plates of two different metals joined by a wire and immersed in a liquid (called the exciting liquid) which acts chemically upon one plate; this, the positive or generating plate, at the expense of which the electrical current is maintained, is usually zinc; the negative plate is often copper, but may be platinum, carbon, silver, etc. The exciting liquid is commonly dilute sulphuric acid, but solutions of sal ammoniac, common salt, etc., are also used. The current flows through the liquid from the positive plate (zinc) to the copper, and through the wire from the positive pole to the negative pole. (See figure.) The current from a simple voltaic cell soon loses its strength, because hydrogen bubbles, liberated in the chemical action on the negative plate, form a film over it. This polarization of the negative plate (see *polarization*) may be partially avoided by mechanical means in a *single-fluid cell*, by using platinum, or silver covered with finely divided platinum, as in the *Smee cell*, or platinized carbon, as in the *Walker cell.* It is more effectually prevented in a *two-fluid cell* by the addition of a second liquid (the depolarizing liquid), with which the hydrogen combines chemically. In the *Grenet cell*, or *bottle-cell*, bichromate of potash is mixed with the sulphuric acid (being hence called a *bichromate cell*) in a vessel of bottle form, and the zinc and carbon are immersed in them; the zinc, however, is raised out of the liquid when the cell is not in use. Practically, the depolarizing liquid is usually separated from the exciting liquid, as in the *compound cell.* One of the best of these is the *Daniell cell*, which consists of a zinc plate immersed in dilute sulphuric acid contained in a porous vessel, outside of which is a perforated copper plate surrounded by a solution of copper sulphate. The action is as follows: The reaction between the zinc and sulphuric acid produces zinc sulphate and hydrogen; the latter, however, instead of collecting on the copper plate, unites with the copper sulphate, forming sulphuric acid and metallic copper. The former goes to keep up the supply of acid in the inner vessel, and the latter is deposited on the copper plate. The consumption of copper sulphate is made good by a supply of crystals in a receptacle at the top. A modified form of the Daniell cell is the *gravity cell*, in which the porous vessel is done away with, and the two liquids are separated by their specific gravities; the copper sulphate surrounds the copper plate at the bottom, and the zinc sulphate the zinc plate at the top. This is the form of cell most used for telegraphic purposes in the United States. Other forms of the compound cell are the *Grove*, in which platinum and nitric

acid take the place of the copper and copper sulphate of the Daniell; the *Bunsen*, which is like the Grove except in the use of carbon instead of platinum; and there are many others. The *Leclanché cell*, much used in connection with electric call-bells (as also with the telephone), consists of a rod of zinc immersed in a solution of sal ammoniac, and a plate of carbon, sometimes, though not necessarily, in a separate porous vessel packed about with powdered manganese dioxid and carbon. This cell rapidly becomes polarized, but if left to itself soon regains its strength, and hence is especially valuable for intermittent use; it has also the advantage that there is no waste of the zinc by local action when not in use. The *silver-chlorid cell*, as devised by De la Rue, consists of zinc acted upon by sal ammoniac and a rod of silver surrounded by a cylinder of silver chlorid. The *Latimer-Clark standard cell* consists of zinc and pure mercury separated by a paste made from sulphates of zinc and mercury; when suitably arranged it maintains a very constant electromotive force, and hence has been used as a standard. **9.** A structure of wrought-iron, consisting usually of four plates riveted to angle-irons. —**10.** A small frame or box employed to hold or inclose a microscopic object.—**Adelomorphous cells.** Same as *principal cells*.—**Alar cells.** See *alar*.—**Amœboid cell, amœbiform cell,** a cell which has no determinate form, or which is capable of executing amœboid movements, and so of changing its form, and even of moving about, like an amœba. Its complete form, including the ovum as a simple cell also, is the basis of the present state of the biological sciences.—**Chalice-cells.** Same as *goblet-cells*.—**Collared cell,** a cell one end of which has a raised rim or border, like a collar, as that of a collar-bearing monad, or choanoflagellate infusorian.—**Condemned cell.** See *condemned*.—**Daughter-cell.** See *mother-cell*, below. —**Deiters's cells,** certain cells intimately connected with the external hair-cells of the cochlea; also, the cells of the neuroglia: sometimes applied to the large cells of the anterior cornua of the spinal cord, which give off Deiters's processes. The new cells are called *daughter-cells*. —**Peaucellier cell,** in *mech.*, a plane linkage discovered by Lieut. Peaucellier in 1864, which first solved the celebrated problem of parallel motion. It is composed of two long links of equal length, pivoted together at one end and at the other pivoted to the opposite angles of a rhombus composed of four equal and shorter links. For use, the junction, *A*, of the two long links is fixed in position, and an extra link, *BC*, is attached to the angle of the rhombus nearest to *A*. The other end, *B*, of the extra link is fixed in position, usually at a distance from *A* equal to *BC*. In this case, when *BC* turns about *B* as a center, the vertex, *E*, of the rhombus most distant from *A* will describe a right line. The production of this effect by link-work alone had been much sought after since the invention of the steam-engine.—**Principal cells,** the central cells of the cardiac glands of the stomach. cellulose^2 (sel′ụ̄-lōs), *n.* and *a.* [< *cellula* + *-ose.*] **I.** *n.* In *bot.*, the essential constituent of the primary wall-membrane of all cells, a secretion from the contained protoplasm, isomerous with starch in its composition, and allied to starch, sugar, and inulin. It rarely or never exists in a simple condition unmixed with coloring or mineral matters, etc.; and with age it becomes largely transformed into lignin, suberin, or mucilage. Cotton and the bleached fiber of flax and hemp are nearly pure cellulose, and in some filter-paper it is almost chemically pure. Cellulose is remarkable for its insolubility, being dissolved without change only by an ammoniacal solution of oxid of copper, from which it may be again precipitated. Under the action of concentrated or boiling acids, or of caustic alkalis, many different products are obtained, according to the method of treatment. It is changed to glucose by long boiling with dilute sulphuric or hydrochloric acid; a substance resembling parchment is obtained by treating unsized paper with cold sulphuric acid; strong nitric acid, or a mixture of nitric and sulphuric acids, converts forms of cellulose into guncotton, etc. In its unchanged condition it is not colored by iodine except usually with a faint yellowish tint, which becomes a bright blue on the addition of strong sulphuric acid. Cellulose is also said to exist in the tunics of *Ascidia* and in other invertebrates.—**Starch-cellulose**, the delicate skeleton of cellulose which remains when starch-granules are dissolved in saliva or pepsin.

Κέλται (sing. *Κέλτης), earlier Κελτοί (sing. *Κελτός), a name at first vaguely applied to a Western people, afterward the regular designation of the Celtic race. Origin unknown; perhaps akin to the equiv. L. *Galli*, the 'Gauls,' and to the Celtic *Gael*, q. v. The W. *Celtiad* (as if 'a dweller in coverts,' < *celt*, a covert, shelter, < *celu*, hide, conceal, < L. *celare*, hide: see *cell* and *conceal*), a Celt, Gael. *Ceiltich* and *Coilltich*, pl., Celts, are prob. due to the L. *Celtæ*. The reg. Eng. spelling is *Celt* and the reg. Eng. pron. selt; but the spelling *Kelt*, after G. *Kelt*, Gr. Κέλται, W. *Celtiad* (pron. kel′ti-ad), is preferred by some recent writers.] A member of one of the peoples speaking languages akin to those of Wales, Ireland, the Highlands of Scotland, and Brittany, and constituting a branch or principal division of the Indo-European family. Formerly these peoples occupied, partly or wholly, France, Spain, northern Italy, the western parts of Germany, and the British islands. Of the remaining Celtic languages and peoples there are two chief divisions, viz., the *Gadhelic*, comprising the Highlanders of Scotland, the Irish, and the Manx, and the *Cymric*, comprising the Welsh and Bretons; the *Cornish*, of Cornwall, related to the latter, is only recently extinct.

celt^2 (selt), *n.* [< W. *cellt*, a flintstone.] In *archæol.*, an implement or weapon widely used among primitive and uncivilized races, and having the general form of a chisel or an ax-blade. In the eighteenth century the name was given to the stone and bronze implements of this general shape, without careful consideration of their probable uses. The stone celts are all of a form more or less closely resembling the head of a hatchet, differing only in being sometimes flatter and with a longer cutting edge, sometimes of a section nearly circular, pointed at one end, and coming abruptly to an edge at the other. The bronze celts, the forms of which are very varied, may be divided into three principal classes: First, chisel-shaped blades without sockets, but with raised rims on each side forming a pair of grooves, apparently intended to retain a wooden handle fitted on in the direction of the length of the blade; these may be considered as spades intended for agricultural labor. Second, chisel-shaped blades, having a deep socket at the end opposite the cutting edge, and usually fitted with a loop or pierced ear on one side. Third, blades, also with a socket, but shorter and broader; these, which have often been called ax-heads, are thought rather to be ferrules for the butt-end of spear-shafts and the like, the edge enabling them to be driven into the ground. See *amgarn, paalstab, pot-celt*, and *socket-celt.*

Formerly a general name for many instruments having several wire strings which were struck with hammers. The term doubtless is derived from the bell-like tone thus produced. 2. Such an instrument played by means of keys or digitals; a harpsichord, and, later, a pianoforte or organ keyboard: short for *clavicembalo*.

cement (sẹ̄-ment′ or sem′ent), *n.* [Early mod. E., and later also *ciment*, < ME. *ciment, cyment, syment*, < OF. *ciment, cement*, F. *ciment* = Pr. *cimen* = Sp. Pg. It. *cimento*, cement, < L. *cæmentum*, a rough stone, rubble, chippings of stone, prop. contr. from **cædimentum*, < *cædere*, cut. The noun is prop. pronounced, as being of ME. origin, sem′ent (formerly, in the spelling *ciment*, sim′ent); but the pron. sẹ̄-ment′, after the verb, is now more common.] 1. Any composition which at one temperature or one degree of moisture is plastic and at another is tenacious. Cements are used for uniting materials of the same kind or of different kinds, or for forming smooth and impervious surfaces or coatings. The term properly includes papier-maché, gums, glues, mucilages, limes, mortars, and a great number of compounds of such nature as to admit of their assuming, under certain conditions, sticky, tenacious, or stone-like consistency. Cements are divided into classes, according to their use, as *glass-cement*, etc. The materials forming the cement are mixed with water, acids, oils, etc., to a paste, and applied to the surfaces to be joined together or coated, and then dried; or, either wet or dry, are applied hot, or are applied and then heated, when they become hard and tenacious. This hardening is called the "setting" of the cement. The cements in use in the arts are exceedingly numerous, and are composed of a great variety of materials.

Specifically—2. A kind of mortar which sets or hardens under water: hence often called *hydraulic cement*. It is, however, often used in superior masonwork not intended to be covered by water. There are two kinds of cement well known in Europe, *Portland* and *Roman*. Portland cement (named from its resemblance in color to Portland stone) is made from selected materials, commonly chalk and river-mud or alluvial clay. Roman cement (unknown to the Romans, but deriving its name from a supposed resemblance to Roman mortar) was originally made of volcanic ashes, but is now more often made from materials obtained from the Jurassic series of rocks. Much of the cement used in the United States is that known as *Rosendale*. See *cement-stone*. 3. A name sometimes given by placer and hydraulic miners to any rather firmly compacted mass of detrital auriferous material. Usually, however, the application of the word is limited to detrital material of volcanic origin, consisting of fragmentary substances mixed with ashes and caused to cohere somewhat firmly by pressure, or by silicious or calcareous matter. 4. In *anat.*, the cortical substance which forms the outer crust of a tooth from the point where the enamel terminates to the apex of the root, resembling bone in anatomical structure and chemical composition. Also called *cementum*. See cut under *tooth*.

> As age advances, the *cement* increases in thickness, and gives rise to those bony growths, or exostoses, so common in the teeth of the aged.

It consists of sal ammoniac, sulphur, and finely pulverized castings or borings made into a paste.—**Portland cement, Roman cement.** See 2.—**Royal cement**†, a composition consisting of 1 part of sal ammoniac, 2 parts of common salt, and 4 parts of potters' earth or powdered bricks, the whole moistened with urine, and used in the cementation or purifying of gold. *E. Phillips*, 1706.—**Rubber cement.** (*a*) Clean caoutchouc triturated with a small quantity of sulphur and dissolved in benzine or some other hydrocarbon. It is used for covering cloth of which boots, shoes, coats, belting, etc., are made. (*b*) A cement for securing rubber rings or plates to metal or wood. It consists of a solution of shellac in ten times its own weight of strong ammonia, left for a considerable time to soften without heat. Also called *caoutchouc cement*. *E. H. Knight*.

cementation (sem-en-tā′shọ̈n), *n.* [< *cement* + *-ation*.] 1. The act of cementing; the act of uniting by an adhesive substance.—2. A metallurgical process in which two substances are heated in contact for the purpose of effecting some important chemical change in one of them. Iron may be carburized or decarburized by cementation. Thus, bar-iron, embedded in charcoal-powder and exposed to a temperature above redness, is gradually converted into steel, and in this way steel was formerly made in large quantity. This is carburization by cementation. Again, if cast-iron be embedded in the powder of red hematite and kept for some time at a red heat, it is decarburized, and acquires a considerable degree of malleability. This is the method in use for producing what is known as *malleable cast-iron*. Malleable iron is also converted into steel by keeping it immersed in molten pig-iron. This is a very ancient process, and is a kind of cementation. Silver is also separated from gold by cementation with salt and with potassium nitrate. These last methods of separation of the two precious metals are also very ancient, but are now nearly obsolete. See *case-hardening*.

cement-mill (sẹ̄-ment′mil), *n.* A mill for crushing the stony concretions from which a form of cement is obtained.

cement-stone (sẹ̄-ment′stōn), *n.* Any rock which is capable of furnishing cement when properly treated. Most of the rock used in the United States for cement comes from the Tentaculite division of the Lower Helderberg series, and the product takes the name of *Rosendale cement* from the town of Rosendale in Ulster county, New York, where it is chiefly worked. The rock which furnishes cement is a more or less impure limestone, or mixture of carbonate of lime with sand and clay. Pure limestone will not make a mortar which will set under water; but some magnesian limestones have hydraulic properties. The theory of the hydraulicity of cement is not clearly understood, although much has been written in regard to it. Also *cement-rock*.

A vessel in which incense is burned before an altar. Censers are now usually made of metal in the shape of a cup with a perforated cover, and contain burning charcoal or other material capable of producing sufficient heat to burn the fragrant gums used as incense. The censer is swung in the hand by chains. In ancient Roman usage incense was carried to the altar in a square box called an *acerra*, from which it was taken and sprinkled on the flame. A similar practice prevailed among the Greeks. The ecclesiastical term for a censer is *thurible.* The only distinct biblical precepts regarding the use of the censer are found in Num. iv. 14 and Lev. xvi. 12. According to Bingham, neither incense nor censers were used in the Christian church during the first three centuries. They are now used in the Greek Church, the Roman Catholic Church, the Catholic Apostolic Church, and in some Anglican and other churches.

One of two superior magistrates of ancient Rome, who in the latter half of the fifth century B. C. succeeded to certain powers which had before been exercised by the consuls. Their functions included—(*a*) the keeping of a register (census) of all Roman citizens, with the amount of their property, for the ends of taxation, and for the classification of the citizens according to their possessions, from the rank of senator down; (*b*) the disciplinary control of manners and morals, in which their power was absolute, both in sumptuary matters and in the degradation of any citizen from his proper class for reasons affecting the moral or material welfare of the state, or in the imposition of fines at will upon those deemed by them to be offenders; (*c*) the practical administration of the public finances, including the control under the senate of both direct and indirect taxation, the determining of the expenditures of the state other than fixed charges, the letting of public contracts, and the supreme direction of public works. censorship (sen′sọr-ship), *n.* [< *censor* + *-ship.*] The office or dignity of a censor; the time during which a censor holds his office.—**Censorship of the press,** a regulation which formerly prevailed in most countries of Europe, and is still in force in some, according to which manuscripts, printed books, pamphlets, plays, and newspapers are examined by officials, civil or ecclesiastical, appointed for the purpose, who are empowered to prevent publication or suppress any parts of the text if they find anything in such books or writings obnoxious to the prevailing political or religious system. A general censorship of the press was established by the Roman Catholic Church as early as 1515, and is still enforced so far as its authority extends. In England there were "licensers" of books, who were for the most part bishops; a general system of censorship, established by a decree of the Star Chamber in 1637, remained in force during the civil war, and was confirmed by act of Parliament in 1643. Against this act Milton protested in his "Areopagitica: a speech for the liberty of Unlicensed Printing." The censorship, or license system, was abolished in England in 1694. In France a general censorship of the press existed from the introduction of printing till 1789, when it was abolished; and it has since been several times restored with various ameliorations and again abolished, finally in 1830, though a modified censorship of newspapers was afterward established and still exists. In Russia there is a very rigid censorship of the press. In Spain the censorship was abolished by the Constitution of 1837. In Germany, after great vicissitudes, the censorship has remained abolished since 1848. There is no authoritative censorship in Norway, Sweden, Denmark, the Netherlands, or Belgium, but penalties are imposed upon those who offend through the press. In the United States the press is, and always has been, absolutely free from any form of political or ecclesiastical censorship.

To *censure* is to express an unfavorable opinion; it is less personal than the previous terms. *Remonstrate with* and *expostulate with* are more argumentative and imply more of advice than either *reprove* or *censure*; they also apply only to acts now taking place or about to take place, while *censure* applies only to what is past. To *reproach* a person is to lay blame upon him in direct address, and with feeling, to endeavor to shame him with what he has done. The myth is probably of Eastern origin. The centaurs, supposed to have inhabited Thessaly, were rude and savage beings, embodying the destructive and ungovernable forces of nature. Chiron, the wise instructor of Achilles, and Pholus, the friend of Hercules, were beneficent centaurs. In art the centaur was originally represented as a complete man, to whose body were attached, behind, the barrel and hind quarters of a horse; later this ungainly combination was abandoned, and was universally replaced by the form in which the human body to the waist took the place of the head and neck of the horse. Examples of the primitive type of centaur survive on archaic painted vases, in a few small bronzes, terra-cottas, etc., among the reliefs from the temple of Assos, and in certain wall-paintings.

Five degrees centigrade are equivalent to 9° Fahrenheit, and the point marked 10° on the centigrade scale corresponds to the point marked 50° on the Fahrenheit scale. The simplest rules for reducing a temperature noted on one scale to the corresponding number of degrees in the other are as follows: To reduce a temperature on the centigrade scale to Fahrenheit—Subtract 10° from the given temperature, subtract from the remainder one tenth of itself, double the last remainder, and add 50° to the product. To reduce a temperature on the Fahrenheit scale to centigrade—Subtract 50° from the given temperature, divide the remainder by 2, multiply the quotient by 10, divide the product by 9, and add 10° to the last quotient. A period of one hundred years, reckoned from any starting-point: as, a *century* of national independence; a *century* of oppression. Specifically, one of a number of hundred-year periods, reckoned either forward or backward from some recognized era. Thus the *first century* of the Christian era began with the year A. D. 1 and extended to the end of the year 100; the *third century* began with 201 and ended with 300; and the *eighteenth century* began with 1701 and ended with 1800, the year completing the hundred-year period in each instance giving name to the century. When used absolutely, without explanatory adjunct of any kind, the centuries of the Christian era are always meant. The centuries before Christ are reckoned backward in their order from the Christian era, and those after Christ are reckoned forward: as, the fourth *century* B. C. (from 301 B. C. backward to 400).

The little brain or hind-brain of a vertebrate animal; a lobe of the brain developed on the dorsal side of the cerebrospinal axis, between the corpora quadrigemina in front and the medulla oblongata behind, and forming part of the roof of the fourth ventricle. The pons Varolii is the corresponding ventral portion of the cerebrospinal axis, and these two parts together are sometimes called the *epencephalon.* In man the cerebellum is a well-developed mass, having an average weight of about 5½ ounces, occupying the inferior occipital fossa, and separated from the posterior portions of the cerebral hemispheres above by the tentorium. A median portion or vermis and two lateral hemispheres are distinguished, and these are divided by transverse clefts into thin, closely packed laminæ. The cerebellum has three pairs of peduncles by which it is connected with the rest of the brain: the superior peduncles, which join it with the cerebrum; the middle peduncles, which pass down on either side to form the pons Varolii; and the inferior peduncles or restiform bodies, which connect it with the medulla oblongata. The surface of the laminæ is of gray matter, while the interior is white, so that a section at right angles to the lamellæ presents a foliaceous appearance, which has received the name of *arbor-vitæ.* There are other masses of gray matter within, namely, the corpus dentatum, nucleus emboliformis, nucleus globosus, and nucleus fastigii. (See *corpus* and *nucleus.*) The cerebellum seems to be principally concerned with the coördination of voluntary movements. See cuts under *brain* and *corpus.* 2. Pertaining to the brain of a vertebrate animal, whether to the whole brain or to the brain proper or cerebrum.—2. Pertaining to the anterior or preoral ganglia of the nervous system in invertebrate animals, regarded as the analogue or homologue of the vertebrate brain. These ganglia are commonly connected with the rest of the nervous system by an esophageal ring, or commissural fibers encircling the anterior part of the alimentary canal. See *esophageal ring*, under *esophageal.*—**Cerebral carotid artery.** Same as *internal carotid.* See *carotid, n.*—**Cerebral ganglia**, in any invertebrate, ganglia of the nervous system situated in the head, or a part of the body considered as the head.—**Cerebral hemisphere**, one of the two lateral halves forming the prosencephalon, or cerebrum in its most restricted sense. In man the cerebral hemispheres are highly developed, overlapping the cerebellum behind and the olfactory lobes in front, and the surface is highly convoluted with gyri and sulci. Each hemisphere is primarily divided into frontal, parietal, temporosphenoidal, and occipital lobes. The two hemispheres are connected with each other by the corpus callosum or great white commissure, and with the cerebellum by the parts below. They consist chiefly of white matter invested with gray matter, and contain ganglia of the latter in the interior. See *brain.*—**Cerebral index**, the ratio of the transverse to the anteroposterior diameter of the cranial cavity multiplied by 100.—**Cerebral letters**, in *philol.*, a name often used for certain consonants which occur especially in the Sanskrit alphabet, and are formed by bringing the tip of the tongue backward and placing its under surface against the roof of the mouth: an improper translation of the Sanskrit term *mūrdhanya*, literally, 'head-sounds,' cephalica (from *mūrdhan*, the head, skull). They are also called *lingual* or *cacuminal letters.*—**Cerebral localization.** See *localization.* —**Cerebral maculæ**, blotches of red following on slight irritation of the skin, extending beyond the area irritated, and persisting for several minutes. Form* is the most general of these words; it is impossible to join in worship without the use of some *forms*, however simple; we speak of legal *forms*, etc. *Ceremony* is a broader word than *rite*, in that a *rite* is always solemn and either an act of religion or suggestive of it, as marriage-*rites*, the *rites* of initiation, while *ceremony* goes so far as to cover forms of politeness. A *rite* is generally a prescribed or customary form, while a *ceremony* may be improvised for an occasion: as, the *ceremony* of laying a corner-stone or opening a new bridge. *Observance* is primarily a compliance with a requirement, as in religion, where the word was applied to the act of compliance: as, the *observance* of the sabbath.

Heavy persecution shall arise
On all who in the worship persevere
Of spirit and truth; the rest, far greater part,
Will deem in outward *rites* and specious *forms*
Religion satisfied. *Milton*, P. L., xii. 534.

cesura, cæsura (sẹ̄-zū'rạ̈), *n.*; pl. *cesuras, cæsuræ* (-räz, -rē). [= F. *césure* = Sp. Pg. It. *cesura* = D. *caesuur* = G. *cäsur* = Dan. *cæsur*, < L. *cæsura*, lit. a cutting, < *cædere*, pp. *cæsus*, cut.] In *pros.*, a division made in a line by the termination of a word, especially when this coincides with a pause in delivery or recitation. Strictly, cesura is the division made by the termination of a word within a foot, the division occasioned by the concurrence of the end of a word with the end of a foot being called *dieresis*. This distinction of terms is not, however, generally observed in treating of modern poetry. A *masculine cesura* is one which immediately follows a syllable bearing the ictus or metrical accent; a *feminine cesura* is one which succeeds a metrically unaccented syllable. A cesura is called *trithemimeral, penthemimeral*, or *hephthemimeral*, according as it occurs in the middle of the second, third, or fourth foot. In the dactylic hexameter the cesura after the first of the two short syllables of the dactyl is called the *trochaic cesura* or *cesura after the trochee* (of the second, third, or fourth foot, as the case may be). In the same kind of verse a division at the end of the fourth foot is called a *bucolic cesura*, more accurately a *bucolic dieresis*. In the following examples the cesura is marked by a dagger (†), the dieresis by a parallel (‖). Thus, in the lines of English heroic verse (iambic pentapody) given below there is a dieresis after the third foot of the first line, and a cesura in the fourth and third feet of the second and third lines respectively.

> Bĕfōre | thĕ hĭlls | ăppēar'd, ‖ ŏr fōun | tain flōw'd,
> Thōu with | Ētēr | năl Wĭs | dōm † dĭdst | cōnvērse,
> Wĭsdōm | thȳ sĭs | tēr, † ănd | wĭth hēr | dĭdst | plāy.
> *Milton*, P. L., vii. 8.

A cesura occurs in the fourth foot of this iambic hexapody (trimeter):

> Tŏ dēath's | bĕnūm | mĭng ō | piūm † ăs | mȳ ōn | lȳ cūre.
> *Milton*, S. A., l. 630.

The remaining examples show different cesuras in the dactylic hexameter. One of the most usual is the penthemimeral: as,

> Nāught bŭt trā | dĭtiŏn rĕ | māins † ŏf thĕ | beaūtĭfŭl |
> vĭllăge ŏf | Grānd-Prĕ. *Longfellow*, Evangeline, Int.

The trochaic cesura of the third foot is also very frequent: as,

> Thĭs ĭs thĕ | fōrĕst prĭ | mēvăl. † Thĕ | mūrmŭrĭng | pīnes
> ănd thĕ | hēmlŏcks. *Longfellow*, Evangeline, Int.

An example of the bucolic cesura (dieresis) combined (as is frequent) with the penthemimeral is:

> Wē ŏur | cōuntrȳ | flȳ, † thōu, | Tĭtȳrŭs, ‖ strētched ĭn thĕ
> | shădōw. *Longfellow*, tr. of Virgil's Eclogue, I.

The hephthemimeral is generally preceded by a trithemimeral as secondary cesura: as,

> Bēardĕd wĭth | mōss, † ănd ĭn | gārmĕnts | grēen, † ĭndĭs-
> | tĭnct ĭn thĕ | twĭlĭght. *Longfellow*, Evangeline, Int.

Chalcididæ^{1} (kal-sid'i-dē), *n. pl.* [NL., < *Chalcis*^{1} (*Chalcid-*) + *-idæ.*] In *entom.*, a large family of pupivorous spiculiferous hymenopterous insects, typified by the genus *Chalcis*, composed mainly of minute species most of which are parasitic on the larvæ or eggs of other insects. Some of them attack other parasites of the same or related families. The female chalcid, like the ichneumon-fly, deposits her eggs on the larva or egg which she infests, sometimes on the surface, sometimes beneath it, and often many together. The larvæ which emerge feed on the egg or on the soft parts of the infested larva; the latter is unable to complete its transformations, and eventually dies, when the chalcid emerges either as a perfect insect or as a larva, in the latter case sometimes spinning a rough cocoon in which to pass the pupa state. The *Chalcididæ* in their perfect state have usually hard and often brilliantly metallic bodies, from which the typical genus, *Chalcis*, takes its name; the antennæ are elbowed; the ovipositor issues before the tip of the abdomen; the pronotum does not reach the tegulæ; and the wings are almost devoid of veins. Many species are yet undescribed. Also *Chalcidæ.*

Also *Chaldæan*, *Chaldaic*, and *Chaldee.*—**Chaldean art**, the earliest development of Accadian or Mesopotamian art, from which the later art of Babylon and Assyria was directly derived. Such stone sculptures as have been found, particularly those excavated from 1877 to 1881 from the mound of Tello in southern Chaldea, indicate a much less conventional conception of the human form, and much more artistic promise, than was fulfilled in this branch of art by the Babylonian and Assyrian sculptors.—**Chaldean cycle.** See *cycle.*—**Chaldean era.** See *era.*

The shape of the chalice varies very greatly; but in general the foot is wide-spreading, and a knop is introduced in the stem, sometimes half-way up, sometimes nearer the bowl, the object being to prevent all chance of spilling the consecrated wine, the knop affording a firm hold for the hand.

chalk (châk), *n.* [Early mod. E. also *chaulk*, < ME. *chalk*, < AS. *cealc*, chalk, lime, = D. *kalk* = OHG. *chalch*, MHG. *kalc* (*kalk-*), G. *kalch*, *kalk* = Icel. Sw. Dan. *kalk* = F. *chaux* = Pr. *calz*, *caus* = Sp. Pg. *cal* = It. *calce* = Ir. Gael. *cailc* = W. *calch*, lime, < L. *calx* (*calc-*), limestone, lime, chalk: see *calx*^{1} and *calk*^{2}, and cf. *calcareous*, *causey*, etc.] 1. In *geol.*, a soft white rock, consisting almost entirely of carbonate of lime in a pulverulent or only slightly consolidated state, and readily soiling the fingers when handled. It is seen, when examined through the microscope, to be made up in large part of minute fragments of the shells of *Foraminifera*, mollusks, and echinoderms, and also of spicules of sponges. It does not exactly resemble any deep-sea deposit at present known to be in process of formation. This rock is a very important and conspicuous formation on the south coast of England (which on account of the whiteness of its cliffs is poetically styled Albion) and in the north of France. Under the city of London it has a thickness of from 600 to 800 feet. The chalk gives its name to the so-called Cretaceous formation. It is not known that there is any rock exactly resembling chalk in any other region than that of the Paris and London basins. Chalk, being a nearly pure carbonate of lime in a pulverized condition, is an article of great commercial importance, and is used in a large number of operations. For such purposes it is crushed and levigated. One of its principal uses is for whitening walls, or whitewashing. It is not used with oil, as it has no body with that vehicle; but, on account of its being very much cheaper than lead paint, it supersedes that article to a great extent. There are many names for the various preparations of chalk, as *whiting*, *Spanish white*, *Paris white*, etc. Chalk is not a desirable material for ordinary mortar, but it is used to some extent as one of the ingredients of hydraulic cement. See *cement*, 2.

9. In *law*, an objection to a juror; the claim of a party that a certain juror shall not sit in the cause. The challenge may extend either to the whole panel or body of jurors, called a *challenge to the array*, or only to particular jurors, called a *challenge to the polls*. Both of these challenges are subdivided into *principal challenges* (or challenges for principal cause) and *challenges to the favor*. A *principal challenge* is a challenge which alleges a fact of such a nature that, if proved, the juror is disqualified as a matter of law, without inquiring whether he is actually impartial: as, that one or more of the jury are returned at the nomination of the other party, or are nearly related to the other party. A *challenge to the favor* consists in the allegation by the party of a cause that might probably bias, and the raising of the question whether the juror is in fact impartial: as, a statement that a juror has already formed an opinion, or is prejudiced against the party. A *peremptory challenge*, allowed by statute in many jurisdictions, is a challenge of jurors, to a limited number, to be taken without showing any cause at all.

He has under him a vice-chamberlain.

A lizard-like reptile of the family *Chamæleontidæ*, having a naked body, a prehensile tail, feet suited for grasping branches, and the eye covered by a single circular eyelid with an aperture in the center. There are about 50 species, of which the best-known is *Chamæleon vulgaris*, a native of Africa, extending into Asia and the south of Europe. Its body is 6 or 7 inches long, and the tail 5 inches. The skin is cold to the touch, and contains small grains or eminences which are of a bluish-gray color in the shade, but in the light of the sun all parts of the body become of a grayish-brown or tawny color. The extraordinary faculty which the chameleon possesses of changing its color, in accordance with that of the objects by which it is surrounded or with its temper when disturbed, is due to the presence of clear or pigment-bearing contractile cells placed at various depths in the skin, their contractions and dilatations being under the control of the nervous system. Its power of fasting and habit of inflating itself gave rise to the fable that it lives on air. It is in reality insectivorous, its tongue, which is long and covered with a viscid saliva, being darted at its prey and securing it when touched.

The effervescent or so-called sparkling wine made within the limits of the old province of Champagne in northeastern France, chiefly in the region about Reims, Épernay, Avize, Ay, and Pierry, in the department of Marne. The vineyards are all situated within a district about twenty miles long, from Reims on the north to Vertus on the south, and are generally classed as "of the Hill" (*montagne*) and "of the River," namely, along the Marne; but great quantities of new wine are brought from other regions, and each manufacturer makes a mixture or blend according to his own system, to produce the brand of wine known by his name. The effervescence is artificially produced, and is of the nature of an arrested or incomplete fermentation. The greater or less sweetness of the wine is produced by the addition of a liqueur consisting of sugar-candy dissolved in old wine; the different degrees of sweetness are indicated by the terms *sec*, 'dry,' *doux*, 'sweet,' and *brut*, which last term, denoting originally the new or unmanipulated wine, is now used for the manufactured wines having from 1 to 3 per cent. of liqueur. The sweeter wines are generally the more effervescent.

The *fines champagnes* are the product of a blending of the brandies produced in this and neighboring regions of southwestern France with alcohols derived from grain or from beetroots, the two kinds of alcohol giving rise to distinct flavors in the brandy. An inferior grade, known as *petite champagne*, is made from grapes grown in the southern part of the district.—**Champagne rosé**, champagne having a slightly pink or ruddy tint. This color is usually produced by the addition of a little red wine.—**Still champagne**, properly, non-effervescent wine made in Champagne, of which the best-known is *sillery sec*; improperly, slightly effervescent champagne, as distinguished from the *grand mousseux* or frothing variety.—**Tisane de Champagne.** See *tisane*.

chancel, L. *cancelli*, pl., a grating, latticework: see *cancel*.] 1. *Eccles.*, the inclosed space in a church surrounding the altar, and railed off from the choir; the sanctuary. In small churches having no separate choir the altar-rails (and in some churches the screen or latticework) divide the chancel immediately from the body of the church. In a wider sense the words *chancel* and *choir* are sometimes used to include both the sanctuary and the choir proper. In Greek churches the *bema* answers to the chancel or sanctuary, and the *iconostasis* (as the choir does not intervene between sanctuary and nave) corresponds in some measure to both altar-rails and rood-screen, to the former as separating the altar from the rest of the church, and to the latter as constituting a marked boundary to the nave.

chancellor (chȧn'sel-o̤r), *n.* [< ME. *chanceler*, *chaunceler*, *chaunseler* (always with one *l*), < OF. *chanceler*, *-lier*, F. *chancelier* = Pr. *cancelier*, *chancellier* = Cat. *caceller* = OSp. *canceller*, *canciller*, Sp. *cancelario* = Pg. *chanceller*, *cancellario* = It. *cancelliere* = D. *kanselier* = MLG. *kenselere* = OHG. *chancilāri*, *chenzilāri*, MHG. *kanzelære*, G. *kanzler* = Dan. Sw. *kansler* = Icel. *kanzellari*, *kansellari* = Russ. *kantslerŭ*, < ML. *cancellarius*, a chancellor, orig. (LL.) an officer in charge of records, who stood at the latticed railing inclosing the judgment-seat, and acted as an intermediary between the suitors and the judge; < L. *cancelli*, a latticed railing: see *chancel* and *cancel*, and cf. *chancery*.] 1. Originally, under the later Roman emperors, a doorkeeper or usher, who stood at the latticed railing inclosing the judgment-seat, to keep off the crowd and to introduce such persons as were entitled to pass inside. Later and naturally he became a sort of intermediary between petitioners and the judges, and arranged about their business. In the Eastern Empire, the Roman-German empire, and the kingdoms established on the ruins of the Roman empire, this intermediary doorkeeper became a notary or scribe on whom devolved the duty of preparing and sealing all important documents, such as charters, letters, and other official writings of the crown; hence he became keeper of the great seal, and in consequence of the influence of his position his office came to be one of the most important. From the Roman empire the ecclesiastical court at Rome introduced the office, and the chancery at the Vatican was repeated throughout the several bishoprics, where each diocese, and frequently each of the great monastic houses, had its chancellor.
Hence—2. A secretary; a notary.

One Gilbert Peck, his [the Duke of Buckingham's] *chancellor*. *Shak.*, Hen. VIII., i. 1.

3. In Great Britain: (*a*) The highest judicial officer of the crown, law adviser of the ministry, and keeper of the great seal: more fully designated *lord high chancellor*. He is a cabinet minister and privy councilor by virtue of his office, and prolocutor of the House of Lords by prescription, and ranks next after the princes of the blood and the Archbishop of Canterbury. The writs for the convocation of Parliament are issued by him. To him belongs the appointment of all justices of the peace, and he is the patron of all livings of the crown under the value of twenty marks in the king's books; he is keeper of the sovereign's conscience, visitor of all hospitals and colleges founded by the king, guardian of all charitable uses, and judge of the High Court of Chancery, now called the Chancery Division of the Supreme Court. There is also a lord high chancellor in Ireland at the head of the equity system of that country, and Scotland had a chancellor until the treaty of union with England in 1707. (*b*) An officer, officially styled *chancellor of the duchy of Lancaster*, who presides in person or by deputy over the courts of law and equity in the duchy of Lancaster. He is usually a cabinet minister, and seldom a lawyer. (*c*) The finance minister of the British government, more fully styled *chancellor of the exchequer*. He is invariably a member of the House of Commons (that division of the legislature having the sole right of laying taxes and originating money bills) and also of the cabinet. The chancellor of the exchequer was formerly a judge *ex officio* in the equity department of the Court of Exchequer, taking precedence of all the barons; but when the equitable jurisdiction of this court was transferred by 5 Vict. v. to the Court of Chancery his judicial functions became obsolete. (*d*) In the jury system of Scotland, the preses or foreman of a jury, who announces the verdict when it is a verbal one, and who, when it is in writing, hands it in and indorses it, in the name of the jury, along with the clerk of the court.—4. In France: (*a*) The chief officer of the crown, charged with the custody of the great seal, the administration of justice, and the duty of presiding over the councils of the king. The office was abolished in 1790, revived in name by Napoleon I., and finally abolished in 1848. (*b*) The chief officer of the palace of a queen or prince. (*c*) A secretary, especially of an embassy or a consulate.—5. In the new German empire, the president of the Federal Council, who is also charged with the supreme direction, under the emperor, of all imperial affairs.—6. The chief officer, next to the honorary head, of a military or honorable order, who guards its seal, administers its property, and preserves its records: as, the *chancellor* of the Order of the Garter.—7. *Eccles.*: (*a*) An officer learned in canon law, who acts as vicar-general to a bishop, holds his courts, and directs and advises him in all matters of ecclesiastical law, and is the keeper of his seals. More fully styled *chancellor of a bishop* or *of a diocese*. (*b*) An officer belonging to a cathedral, who arranges the celebration of religious services, hears lessons, lectures in theology, writes letters of the chapter, applies the seal, keeps the books, etc.—8. The titular head of a university, from whom all degrees are supposed to emanate. The chancellor was originally the notary of the chapter of the cathedral. But nobody could preach without the authorization of the bishop; and the pope as the chief of the bishops undertook to regulate this authorization. He made the chancellors of certain cathedrals his deputies for this purpose, and thus they alone could grant the degree of master of theology, the highest of the university, which carried with it the right to preach. The chancellors seldom took an active part in the government of the university. In Great Britain the office is now a merely honorary one, and is usually held by a nobleman or some statesman of eminence. The duties of the chancellor of Oxford or Cambridge are usually discharged by a vice-chancellor. There is an officer with similar functions in several of the colleges of the United States.

There is but one generally recognized species in Europe, *Salvelinus alpinus*, the common red char, formerly called *Salmo umbla*, of which the so-called Windermere char and the Welsh torgoch or redbelly are by most considered to be varieties. It inhabits clear cold waters of Switzerland, Germany, Scandinavia, and Great Britain. The American char nearest the European is known as the *Rangeley lake* (in Maine) *trout*, *Salvelinus oquassa.* The Floeberg char of arctic America is *S. arcturus.* The common American brook-trout, *S. fontinalis*, is also a char. Chars are among the most beautiful and delicious of the salmon family. They are distinguished from the true trouts by having the vomer boat-shaped and without teeth in its shaft. The colors also are characteristic.

The leaves bear leaflets and the organs of fructification. The antheridia are spherical bodies composed externally of eight triangular shield-shaped segments, inclosing a great number of filaments. In each joint or cell of the latter is produced one antherozoid coiled spirally. The carpogonium consists of a central cell which, after fertilization, becomes the fruit and is inclosed by 5 cells twisted spirally around it. The species are usually grouped in two families, each containing two genera. In the *Chareæ*, represented by *Chara*, the stem and leaves are sometimes covered with a cortical layer of cells and are sometimes naked. The leaves are in whorls of from 6 to 12, and the leaflets are always one-celled. In *Nitelleæ*, represented by *Nitella*, the stems are never corticated, and the leaflets are in whorls of from 5 to 8, and often more than one-celled. The circulation of the protoplasm is easily observed in the cells of many *Characeæ.* Several species are incrusted with lime and are very brittle.

Early in the history of English law, the chancellors established the rule that informalities and illegalities which by the common law would invalidate a private trust should not be allowed to defeat a public charity, and that therefore chancery should intervene to prevent the heirs or next of kin from defeating such a gift, should appoint a trustee if none existed, and, if any of the directions of the founder were impracticable, should supply others approximate thereto. The most familiar application of the rule is in the doctrine that the prohibition against perpetuities does not affect a charity. (See *perpetuity*.) The question what constitutes a charity within this rule has been the subject of much litigation.—**Brothers of Charity.** (*a*) A religious order founded by St. John of God at Seville in Spain about 1540, and extended over Spain and France, now having about 100 houses. chasuble (chas′ụ̄-bl), *n.* [Also written *chasible*, *chesible*; < ME. *chesible*, *chesuble*, etc., < OF. **chasible*, *chasuble*, F. *chasuble* (= Sp. *casulla*; cf. MHG. *kasugele*, *kasuckel*, D. *kasuifel*), < ML. *casubula*, *casubla*, equiv. to *casula*, a mantle, a chasuble, lit. a little house (cf. It. *casupola*, a shanty), dim. of L. *casa*, a house: see *casa*. Cf. *casula* and *cassock*, of the same ult. origin.] *Eccles.*, a sleeveless vestment, originally circular in outline, but in medieval and modern use of an elliptical shape, or modified from this so as to be nearly rectangular, and provided with an aperture in the center through which to pass the head. It is worn so as to fall in front and at the back of the wearer to an equal or nearly equal distance, showing only one of its halves at a time. The chasuble is the principal vestment worn by a priest when celebrating the mass or holy communion, and is put on over the alb. It is held to represent the seamless coat of Christ, or charity symbolized by it. The material is usually rich stuff—silk, brocade, or velvet. In its oldest form it was very full and long, reaching nearly to the feet. The medieval or elliptical form, which is sometimes worn in Roman Catholic churches, reaches below the knees, and is generally ornamented with a Y-cross. The shape commonly worn in the Roman Catholic Church, however, does not reach much below the hips, and is nearly rectangular at the back, the part which falls in front being cut away at the sides so as not to impede the movement of the arms, and the two parts are frequently united merely by straps at the shoulders. The chasuble generally has a pillar or vertical stripe at the front, a Y-cross or Latin cross on the back, or on both front and back, and sometimes an edging on both sides. These ornaments are added in a different material with gold or other embroidery, and are known as the *orphreys of the chasuble*. Among the different names of the chasuble, *pænula*, identifying it with the ancient Román garment of that name, is probably the oldest. The same word occurs also in various Greek forms. It is translated "cloke" in 2 Tim. iv. 13, and is the accepted name for the chasuble in the Greek Church, generally in the form *phelonion*. The name *planeta* has also been in use from early times, and is still the term preferred in the official use of the Roman Catholic Church. The *amphibalus*, worn at one time in Gaul, seems to have been similar to or identical with the chasuble. In England the name *vestment* was in use at the time of the Reformation, both for the chasuble alone and for the chasuble with its subsidiary vestments or adjuncts, the stole, amice, and maniple. The use of the chasuble in Anglican churches continued long after the Reformation, and is maintained by certain of them (on authority claimed from the Ornaments rubric) at the present day. It is also worn in the Greek Church. See *ornament*.

Dan. *ost*, cheese.] **1.** The curd or casein of milk, coagulated by rennet or some acid, separated from the serum or whey, and pressed in a vat, hoop, or mold. All the acids separate the cheese from the whey; neutral salts, and likewise all earthy and metallic salts, produce the same effect; but rennet, which is made by macerating in water a piece of the last stomach of a calf, salted and dried for this purpose, is most efficient. The flowers of the *Galium verum*, or yellow lady's-bedstraw, and the juice of the fig-tree very readily coagulate milk. There are many kinds of cheese, which differ from one another according to the quality of the milk employed and the mode of preparation. *Soft cheeses*, such as cream-cheese, Bath and Yorkshire cheese, will not keep long. *Hard cheeses*, as Cheshire, Gloucester, Cheddar, Parmesan, and Dutch, can be kept a long time. There is also an intermediate class, as Gruyère, Stilton, etc. Cheese is composed of from 30 to 50 per cent. of water, 20 to 35 per cent. of casein, 18 to 30 per cent. of fat, and 4 to 6 per cent. of mineral matter.

The *Testudinata* or shield-reptiles; the turtles and tortoises; an order of *Reptilia*, in which the body is inclosed in a shell consisting of a carapace and a plastron, from between which the head, tail, and four limbs protrude. These animals have the bones of the skull united to such a degree that the quadrates and pterygoids form part of the same mass as the rest; there are no teeth, the jaws being incased in horn and forming a beak; the eyes are provided with eyelids; and a sacrum is developed. In consequence of the formation of the shell, the cervical and caudal regions are the only movable parts of the spinal column; the dorsal vertebræ are devoid of transverse processes; the ribs are not movable upon the vertebræ; and the union of the vertebræ and ribs by means of superficial bony plates almost always forms the carapace or upper shell, the lower shell or plastron being composed of dermal bones, usually 9 in number, 1 median, and 4 lateral and paired. Tortoise-shell is the peculiar epidermal or exoskeletal integument of the bony case. The lungs extend into the abdominal cavity with the other viscera. The *Chelonia* are generally sluggish, cold-blooded animals, very tenacious of life, and able to pass

long periods without food. Some, however, are quite active. They are oviparous. Most of the species are carnivorous and predatory, but the true land-tortoises are mainly herbivorous. There are over 200 species, among them a few gigantic ones, as the tortoises of the Galapagos and Mascarene islands: one of the fossil species is said to have been about 20 feet long. The living genera are very numerous. The *Chelonia* are variously subdivided. They were formerly generally distributed among four families, the club-footed land-tortoises, the related fresh-water tortoises, the soft tortoises, and the sea-turtles. Huxley called these four groups *Testudinea*, *Emydea*, *Trionychoidea*, and *Euereta*. These groups have, however, been long discarded, and the species are now segregated among many families which have been variously combined. Most of the species of the southern hemisphere belong to a peculiar old-fashioned group, the pleurodirous, while those of the northern are cryptodirous. Also *Chelonides*, *Chelonii*.

Chemical acetification. See *acetification*.—**Chemical action.** See *action*.—**Chemical affinity, elective affinity,** names formerly used for chemical force, and implying a property inherent in atoms of selecting other atoms with which to unite, or of preferring one combination to another.—**Chemical analysis,** the resolution of complex bodies into their elements. It is either qualitative or quantitative. Qualitative analysis consists in the determination of the component parts merely as respects their nature, and without regard to their relative proportions. Quantitative analysis consists in the determination of the relative proportions of the components.—**Chemical black, bronze.** See *black*, *bronze*.—**Chemical change,** as distinguished from *physical change*, a change which destroys the identity of the substance affected. A physical change is manifested without loss of identity by the substance. Thus, a mass of copper may be reduced to fine particles, drawn into wire, melted and cast into ingots or charged with electricity, without losing its identity as copper. But if copper is put into nitric acid, it dissolves and is converted into another substance, copper nitrate. The copper, in consequence, has lost its identity, and has undergone a chemical change.—**Chemical combination,** the intimate union by chemical force of two or more elements or compounds to form a new compound differing in properties from either of its constituent bodies. It differs from *mechanical mixture* in that each element of a chemical combination has a certain fixed and invariable combining proportion, whereas a mixture of substances can be made with varying amounts of its ingredients. In a mechanical mixture the particles of each of its ingredients can usually be identified and separated by mechanical means; in a chemical combination the constituents are so blended that they cannot be identified. Thus, if chlorin and hydrogen gas are mixed in any desired proportion, the chlorin in the mixture will be evident by its characteristic color and odor. But if this mechanical mixture is exposed to strong light, a chemical combination takes place rapidly between the two gases, with evolution of heat. They combine, however, only in exactly equal volumes, and if an excess of either is present it remains uncombined. In the new compound, hydrochloric acid, chlorin cannot be detected by either color or smell, nor be isolated except by chemical means.—**Chemical decomposition,** the separation by chemical force of the component parts of bodies from one another, or the resolution of bodies into their elements.—**Chemical equation,** a symbolic expression used to represent a chemical reaction. The reagents, or bodies which enter into the reaction, form the left-hand member of the equation, and the resultants of the reaction form the right-hand member. Thus, the fact that calcium chlorid and sodium carbonate when brought together in solution react on each other, forming calcium carbonate and sodium chlorid, is expressed by the following equation:

$$CaCl_2 + Na_2CO_3 = CaCO_3 + 2NaCl.$$

This is a true equation in the algebraic sense, because the value of the two members is the same. Since matter is indestructible, nothing is lost in the reaction, and the weights of calcium chlorid and sodium carbonate which reacted must be precisely the same as the combined weights of the resultant calcium carbonate and sodium chlorid.—**Chemical equivalent, extinguisher, ferment, fire-engine,** etc. See the nouns.—**Chemical force,** the force which binds together the atoms in a molecule, and causes chemical changes when dissimilar molecules are brought within the sphere of its action under proper conditions.—**Chemical formula,** a symbolic expression used to represent the composition of a substance. In the formulas now generally adopted by chemists each elementary substance is indicated by the first letter or letters of its name, called its chemical symbol; and to express the compounds of the elements, their symbols are arranged together, each denoting a single atom, and small numbers are written after a symbol and a little below (sometimes, and formerly always, above) the line, indicating how many atoms of the element exist in the compound. Thus, H means 1 atom of hydrogen; H_2O means 2 atoms of hydrogen united with 1 of oxygen, forming the compound water; KHO means 1 atom of potassium (kalium), 1 of hydrogen, and 1 of oxygen, forming the compound potassium hydrate; and so on. If a number is placed at the beginning of the formula, it multiplies the entire formula like an algebraic coefficient; thus, $2H_2O$ means 2 parts or 2 molecules of water. So, too, a small number placed after a parenthesis multiplies the portion included; thus, $Ca_3(PO_4)_2$ denotes 3 atoms of calcium combined with 2 equivalents of the radical PO_4, forming tricalcium phosphate or bone phosphate. Chemical formulas are of two kinds, *empirical* and *rational*. An empirical formula expresses simply the relative number of atoms of the elements present; a rational formula expresses not only the relative number of atoms, but also some conception of the mode of union of the atoms, the groups of radicals contained in the substance, the class to which it belongs, etc. Thus, the empirical formula of acetic acid is $C_2H_4O_2$. Its rational formula ($CH_3CO.OH$) indicates that it may be regarded as made up of the radicals methyl (CH_3), carbonyl (CO), and hydroxyl (OH), and so suggests to the chemist many of its properties and reactions. In the earlier castles the system of defense adopted involved almost complete separation of each tower or post from the others, and the *chemin-de-ronde* was intercepted by each of these; this caused the loss of many fortresses, a sudden attack often shutting up the defenders in their isolated posts. The castles of the fourteenth century were free from this defect, the *chemin-de-ronde* becoming spacious and uninterrupted, so that the garrison could be massed readily at any point.

(*b*) The space between the chemise-wall and the main work which it protects, sometimes covered with a penthouse roof.—**4.** A sleeve or an envelop of sheet-iron placed on a mandrel to receive the coils of steel ribbon used in making shot-gun barrels. Other names for the science are *chemics* and *chemy*: see these words.] The science of the composition of material things and the changes which they undergo in consequence of changes in their ultimate composition. It regards all substances as made up of atoms (see *atom*) which are indivisible and have certain unchanging properties. An elementary substance consists of groups of chemically united atoms of the same kind; a compound substance, of groups of chemically united atoms of two or more different kinds. All compound substances, and most elementary ones, consist of definite groups of chemically united atoms which are called *molecules*. Each molecule has exactly the same chemical composition and properties as the whole mass of the substance, and is the smallest mass into which the substance can be divided without losing its identity. The laws, causes, and effects of changes in the kind, and the number and arrangement, of atoms within the molecule are the subject-matter of the science. Also called *applied chemistry*.—**Theoretical chemistry,** the study of the general laws governing chemical action, and of their bearing on the theories of matter.—**Thermal chemistry,** or **thermo-chemistry,** treats of the phenomena and laws of the development and disappearance of heat induced by chemical reactions.

chemitype (kem′i-tīp), *n.* [< *chemi*(*cal*) + *type*.] A process for obtaining casts in relief from engravings. A polished zinc plate is covered with an etching-ground, on which the design is etched with a point and bitten in with dilute aqua fortis. The etching-ground is then removed, and every particle of the acid well cleaned off. The plate is covered with filings of a fusible metal, and heated until the metal has melted and filled the engraving. When cold it is scraped away to the level of the zinc plate in such a manner that none of it remains except what has entered the engraved lines. The plate is next submitted to the action of a weak solution of muriatic acid; and, as the one of these metals is negative and the other positive, the zinc alone is eaten away by the acid, so that the fusible metal which has entered the hollows of the engraving is left in relief, and may be printed from in a press. Chemitype is particularly adapted for the production of maps.

Traditionally, the name is referred to *Cerasus*, L. *Cerasūs*, Gr. Κερασοῦς, an ancient town in Pontus, where the cherry-tree was native.] **I.** *n.*; pl. *cherries* (-iz). **1.** The fruit of species of *Cerasus* (which is commonly regarded as a subgenus of *Prunus*), consisting of a globose pulpy drupe inclosing a one-seeded smooth stone; also, a tree producing this fruit. The cultivated varieties of the garden-cherry probably all belong to two species, *Prunus Cerasus* and *P. avium*, both doubtless natives of Europe. It is related by Pliny that this fruit or a cultivated variety of it was brought from Cerasus in Pontus to Italy after the defeat of Mithridates by Lucullus, about 70 B. C. It was introduced into England by the Romans about 120 years afterward. There are many kinds, as the red-, black-, and white-hearts, the Mayduke, bigaroon, morello, Kentish, etc. The wild or crab cherry, mazard or gean of Great Britain, is a wild state of the *Prunus avium*, which is also found in various other parts of Europe. From the fruit of its different varieties several highly esteemed cordials are prepared, as the maraschino of Italy, the ratafia of France, the kirschwasser of Germany, etc. To this group of cherries, distinguished by having their flowers and fruits in clusters, belong also the mahaleb cherry (*P. Mahaleb*) of Europe, with very fragrant flowers, and the ground-cherry (*P. Chamæcerasus*), as well as the wild red cherry (*P. Pennsylvanica*) and the dwarf cherry (*P. pumila*) of North America. A second section of the genus has the flowers in racemes, and the fruit smaller and less palatable. To this belong the bird-cherry (*P. Padus*) of Europe, and the wild black cherry, also called the rum- or cabinet-cherry (*P. serotina*), and the choke-cherry (*P. Virginiana*) of America. Still a third section consists of evergreen trees, with the flowers in racemes and the fruit inedible, including the bastard cherry, bay-cherry, or laurel-cherry (*P. Lauro-Cerasus*) of Europe, and the Carolina laurel-cherry (*P. Caroliniana*) of the southern United States.

A double E. pl. *cherubims* occurs in the Bible and elsewhere.] **1.** One of an order of angels variously represented at different times, but generally as winged spirits with a human countenance (often simply as winged heads), and distinguished by their knowledge from the seraphs, whose distinctive quality is love. In the celestial hierarchy cherubs are represented as next in order to seraphs. The first mention of cherubs is in Gen. iii. 24, where their figure is not described, but their office was, with a flaming sword, to keep or guard the way of the tree of life. Figures of a pair of cherubs were placed on the mercy-seat of the ark, and a pair of colossal size overshadowed it in Solomon's temple with the canopy of their contiguously extended wings. They are called "the cherubims of glory" (Heb. ix. 5), as on them the glory, when visible, rested. They were anointed with the holy oil, like the ark itself and the other sacred furniture. Their wings were stretched upward, and their faces turned "toward each other, and toward the mercy-seat." The cherubs seen in Ezekiel's vision had each four heads or faces, the hands of a man, and wings. The four faces were the face of a cherub, that of a man, that of a lion, and that of an eagle. They had the bodily form of a man. (Ezek. x.) The hieroglyphical and emblematical figures embroidered on the veils of the tabernacle were called "cherubims of cunning work" (Ex. xxvi. 1).

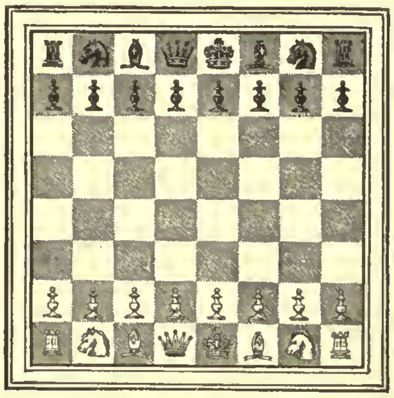
chess^1 (ches), *n.* [Early mod. E. also *chesse*, *chests*, < ME. *ches*, *chesse*, < OF. *esches*, *eschas*, *eskies*, nom. sing. of *eschec*, *eschac*, check; F. pl. *échecs*, chess, = It. *scacchi* (ML. *scacci*), pl., = D. *schaak* = G. *schach* = Dan. *schak* = Sw. *schack* = Icel. *skāk*, chess, ult. < Pers. *shāh*, king: see *check*^{1}, *n.*, and *shah*.] A very ancient game played by two persons or parties with thirty-two pieces on a checkered board divided into sixty-four squares. The squares are alternately light and dark, and in beginning a game the board must be so placed that the square at the right-hand corner is a light one. The vertical rows of squares are called *files*, those which run from right to left, *ranks* or *lines*, and those (of the same color) which run obliquely, *diagonals*. Each party has sixteen pieces, differently colored to distinguish those of one side from those of the other, viz., a king, a queen, two bishops, two knights, and two rooks or castles, placed on the squares of the end line of the board, and eight pawns placed on the next line in front. The king and queen are placed on the two middle squares, the queen on her own color (light or dark), and by the side of each are placed a bishop, a knight, and a rook, in this order. The pieces move according to certain laws over unoccupied squares, the knight alone being free from this latter restriction (see below). The king moves one square in any direction (except into check); the queen in any direction and to any distance along the rows of squares, and also along the diagonals; the rooks or castles in any direction along the files or ranks of squares; the bishops (of which there is one on each color) in any direction along the diagonals of the color on which they are originally placed; the knights one square on one row and then two squares on the row at right angles to it (or two squares and then one) in any direction, without reference to interposing pieces; and the pawns one square ahead on the files. A piece is taken by removing it from the board and placing the capturing piece in its place. In taking, each piece makes some one of its ordinary moves, except the pawn, which takes by moving one square forward on a diagonal; the knight alone can take by jumping over an intervening piece. The object of the game is to capture the king of the opposing party; and this is effected by an attack so planned that it is impossible, either by moving the opposing king or by interposing another piece, to prevent him from being taken on the next move—that is, by placing the opposing king in a check from which he cannot escape. (See *check*^{1}, *checkmate*, and *stalemate*.) The squares of the board are commonly numbered along the files, forward from either party, from the principal pieces placed upon them at the beginning of a game: as, the queen's rook's square (abbreviated Q. R. sq.), queen's rook's second square (Q. R. 2), etc.



Chess-board, with pieces in position.

> Four and twenty ladies fair
> Were playing at the *chess*.
> *The Young Tamlane* (Child's Ballads, I. 117).

Chess has been known to the Chinese for many centuries under a form not very unlike our own game. The board has 64 squares, is played with 16 men on each side, the two at the corners having equal power, and the next two (called horses) having a move equivalent to that of our knight. The chief differences are that the Chinese adversaries are separated by a river, over which some pieces cannot pass, while the "King" is confined to a square of nine moves only; and that the pieces are placed upon the intersections of the lines forming the board, instead of on the squares. *Giles*, Glossary of Reference, p. 38.

The origin of the game of *chess* is lost in obscurity, a fact which has rather invited than repelled learned speculations on the subject. The invention of the pastime has been variously ascribed to the Greeks, Romans, Babylonians, Scythians, Egyptians, Jews, Persians, Chinese, Hindus, Arabians, Araucanians, Castilians, Irish, and Welsh.
